WORKPIECE MATERIAL GROUPS (WMG)

ABOUT DORMER PRAMET'S WORKPIECE MATERIAL CLASSIFICATION

Workpiece **M**aterial **G**roups (**WMG**) are used to support easy and reliable selection of the right cutting tool and starting values for machining conditions in particular applications.
Dormer Pramet classifies workpiece materials into six different coloured groups;

- **Blue**: Steel and cast steel (P-group)
- **Yellow**: Stainless steel (M-group)
- **Red**: Cast iron (K-group)
- **Green**: Non-ferrous metals (N-group)
- **Brown**: High-temperature alloys (S-group)
- **Grey**: Hardened materials (H-group)

Each of these are divided into subgroups on the basis of their structure and/or composition. For example, P-group steel and cast steel is split into four subgroups, namely;

- **P1** – Free machining steel
- **P2** – Plain carbon steel
- **P3** – Alloy steel
- **P4** – Tool steel

A final division includes material properties, such as hardness and ultimate tensile strength. This is to provide our customers with a complete tool recommendation, including starting values for cutting speed and feed.
The table on the next page includes a description of each workpiece material group, as well as examples of commonly used designations.

WMG (WORK MATERIAL GROUP)

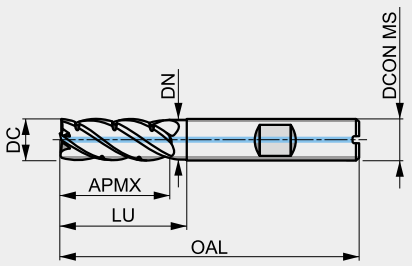

ISO group		WMG (Work Material Group)			Hardness (HB or HRC)	Ultimate Tensile Strength (MPa)
P	P1	P1.1	Free machining steel (carbon steels with increased machinability)	Sulfurized	< 240 HB	≤ 830
		P1.2		Sulfurized and phosphorized	< 180 HB	≤ 620
		P1.3		Sulfurized/phosphorized and leaded	< 180 HB	≤ 620
	P2	P2.1	Plain carbon steel (steels comprised of mainly iron and carbon)	Containing <0.25 % C	< 180 HB	≤ 620
		P2.2		Containing <0.55 % C	< 240 HB	≤ 830
		P2.3		Containing >0.55 % C	< 300 HB	≤ 1030
	P3	P3.1	Alloy steel (carbon steels with an alloying content ≤ 10%)	Annealed	< 180 HB	≤ 620
		P3.2		Hardened and tempered	180 – 260 HB	> 620 ≤ 900
		P3.3			260 – 360 HB	> 900 ≤ 1240
	P4	P4.1	Tool steel (special alloy steel for tools, dies and molds)	Annealed	< 26 HRC	≤ 900
		P4.2		Hardened and tempered	26 – 39 HRC	> 900 ≤ 1240
		P4.3			39 – 45 HRC	> 1240 ≤ 1450
M	M1	M1.1	Ferritic stainless steel (straight chromium non-hardenable alloys)		< 160 HB	≤ 520
		M1.2			160 – 220 HB	> 520 ≤ 700
	M2	M2.1	Martensitic stainless steel (straight chromium hardenable alloys)	Annealed	< 200 HB	≤ 670
		M2.2		Quenched and tempered	200 – 280 HB	> 670 ≤ 950
		M2.3		Precipitation-hardened	280 – 380 HB	> 950 ≤ 1300
	M3	M3.1	Austenitic stainless steel (chromium-nickel and chromium-nickel-manganese alloys)		< 200 HB	≤ 750
		M3.2			200 – 260 HB	> 750 ≤ 870
		M3.3			260 – 300 HB	> 870 ≤ 1040
	M4	M4.1	Austenitic-ferritic (DUPLEX) or super-austenitic stainless steel		< 300 HB	≤ 990
		M4.2	Precipitation hardening austenitic stainless steel		300 – 380 HB	≤ 1320
K	K1	K1.1	Gray iron or Automotive Gray iron (GG) (iron-carbon castings with a lamellar graphite microstructure)	Ferritic or ferritic-pearlitic	< 180 HB	≤ 190
		K1.2		Ferritic-pearlictic or pearlitic	180 – 240 HB	> 190 ≤ 310
		K1.3		Pearlitic	240 – 280 HB	> 310 ≤ 390
	K2	K2.1	Malleable iron (GTS/GTW) (iron-carbon castings with a graphite-free microstructure)	Ferritic	< 160 HB	≤ 400
		K2.2		Ferritic or pearlitic	160 – 200 HB	> 400 ≤ 550
		K2.3		Pearlitic	200 – 240 HB	> 550 ≤ 660
	K3	K3.1	Ductile iron (GGG) (iron-carbon castings with a nodular graphite microstructure)	Ferritic	< 180 HB	≤ 560
		K3.2		Ferritic or pearlitic	180 – 220 HB	> 560 ≤ 680
		K3.3		Pearlitic	220 – 260 HB	> 680 ≤ 800
	K4	K4.1	Austenitic gray iron (ASTM A436) (iron-carbon alloy castings with an austenitic lamellar graphite microstructure)		< 180 HB	≤ 190
		K4.2	Austenitic ductile iron (ASTM A439 or ASTM A571) (iron-carbon alloy castings with an austenitic nodular graphite microstructure)		< 240 HB	≤ 740
		K4.3	Austempered ductile iron (ASTM A897) (iron-carbon alloy castings with an ausferrite microstructure)		< 280 HB	> 840 ≤ 980
		K4.4			280 – 320 HB	> 980 ≤ 1130
		K4.5			320 – 360 HB	> 1130 ≤ 1280
	K5	K5.1	Compacted graphite iron CGI (ASTM A842) (iron-carbon castings with a vermicular graphite structure)	Ferritic	< 180 HB	≤ 400
		K5.2		Ferritic-pearlitic	180 – 220 HB	> 400 ≤ 450
		K5.3		Pearlitic	220 – 260 HB	> 450 ≤ 500
N	N1	N1.1	Commercially pure wrought aluminium		< 60 HB	≤ 240
		N1.2	Wrought aluminium alloys	Half hard tempered	60 – 100 HB	> 240 ≤ 400
		N1.3		Full hard tempered	100 – 150 HB	> 400 ≤ 590
	N2	N2.1	Cast aluminium alloys		< 75 HB	≤ 240
		N2.2			75 – 90 HB	> 240 ≤ 270
		N2.3			90 – 140 HB	> 270 ≤ 440
	N3	N3.1	Free-cutting copper-alloys materials with excellent machining properties		–	–
		N3.2	Short-chip copper-alloys with good to moderate machining properties		–	–
		N3.3	Electrolytic copper and long-chip copper-alloys with moderate to poor machining properties		–	–
	N4	N4.1	Thermoplastic polymers		–	–
		N4.2	Thermosetting polymers		–	–
		N4.3	Reinforced polymers or composites		–	–
	N5	N5.1	Graphite		–	–
S	S1	S1.1	Titanium or titanium alloys		< 200 HB	≤ 660
		S1.2			200 – 280 HB	> 660 ≤ 950
		S1.3			280 – 360 HB	> 950 ≤ 1200
	S2	S2.1	Fe-based high-temperature alloys		< 200 HB	≤ 690
		S2.2			200 – 280 HB	> 690 ≤ 970
	S3	S3.1	Ni-based high-temperature alloys		< 280 HB	≤ 940
		S3.2			280 – 360 HB	> 940 ≤ 1200
	S4	S4.1	Co-based high-temperature alloys		< 240 HB	≤ 800
		S4.2			240 – 320 HB	> 800 ≤ 1070
H	H1	H1.1	Chilled cast iron		< 440 HB	–
	H2	H2.1	Hardened cast iron		< 55 HRC	–
		H2.2			> 55 HRC	–
	H3	H3.1	Hardened steel < 55 HRC		< 51 HRC	–
		H3.2			51 – 55 HRC	–
	H4	H4.1	Hardened steel > 55 HRC		55 – 59 HRC	–
		H4.2			> 59 HRC	–

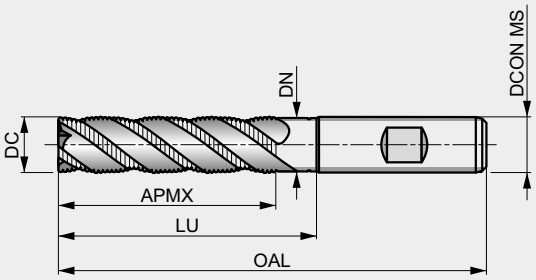

CUTTING TOOL PARAMETERS ACCORDING TO ISO 13399

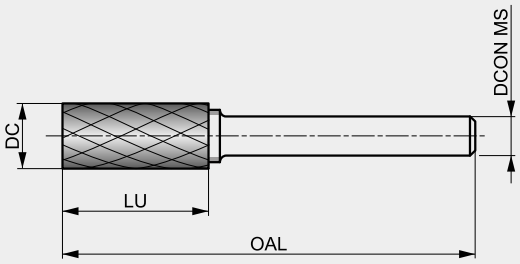

All cutting tools are defined by a number of parameters according to the standard ISO 13399. This list contains all the parameters used in this catalogue and their definitions.

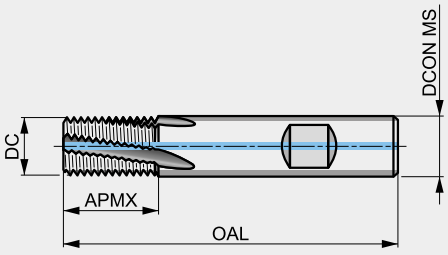

ISO 13399 is an international cutting tool information standard. It provides dimensions and parameters in a neutral format that is independent of any particular system or company nomenclature. When cutting tools are clearly defined according to a global standard, all types of software can process the electronic data more quickly, improving the quality of communication and helping to make the exchange of information run smoothly. Supporting a common language in our cutting tool descriptions this will assist system to system communication. It will save you a significant amount of time, providing an easier gathering of high-quality data across our 40,000 solid and indexable tools. By using an ISO 13399 compliant system, there will be no need to manually interpret data and key-enter it into your system.

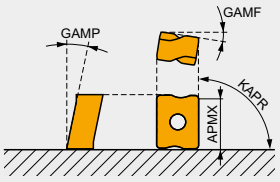

EXAMPLES ONLY!

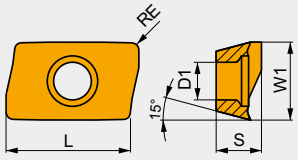

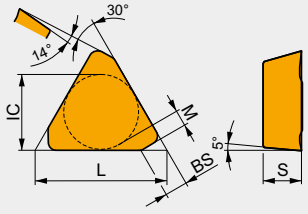

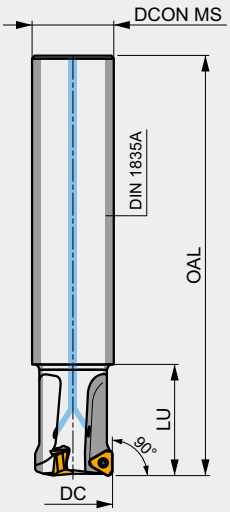

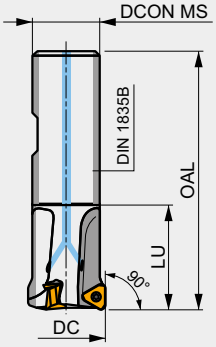

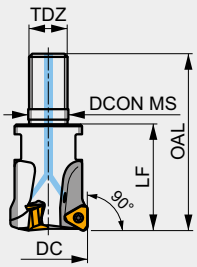

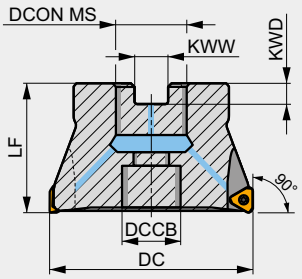

CUTTING TOOL PARAMETERS ACCORDING TO ISO 13399

ISO 13399 code	Description
APMX	Depth of cut maximum
BD	Body diameter
BDX	Body diameter maximum
BCH	Corner chamfer length
BS	Wiper edge length
CBDP	Connection bore depth
CDI	Insert cutting diameter
CDX	Cutting depth maximum
CW	Cutting width
CZC MS	Connection size code machine side
D1	Fixing hole diameter
DAH4	Diameter access hole
DAH5	Diameter access hole
DAH6	Diameter access hole
DBC1	Diameter bolt circle 1
DBC2	Diameter bolt circle 2
DBC4	Diameter bolt circle
DBC5	Diameter bolt circle
DBC6	Diameter bolt circle
DC	Cutting diameter
DCB	Connection bore diameter
DCCB	Counterbore diameter connection bore
DCN	Cutting diameter minimum
DCON MS	Connection diameter
DCX	Cutting diameter maximum
DHUB	Hub diameter
DN	Neck diameter
GAMF	Radial rake angle
GAMP	Axial rake angle

ISO 13399 code	Description
CHW	Corner chamfer width
IC	Inscribed circle diameter
INSD	Insert diameter
INSL	Insert length
KAPR	Tool cutting edge angle
KWD	Keyway depth
KWW	Keyway width
L	Cutting edge length
LB	Body length
LE	Cutting edge effective length
LF	Functional length
LH	Head length
LU	Usable length
LUX	Usable length maximum
M	M-dimension

DORMER

2

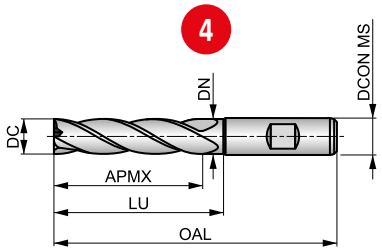

Multi-Flute HSS-E-PM Long Series End Mill, Bright Finish

Long cut length, 4, 5 or 6 flute design provides high rigidity for finishing deep profiles in mild steels and non-ferrous materials, such as aluminium and medium strength titanium alloys.

SOLID HM MILLS

SOLID HM MILLS – TOOL MATERIALS AND SURFACE COATINGS NAVIGATOR

HM materials

Carbide Materials (or Hard Materials)	HM	A sintered powder metallurgy substrate, consisting of a metallic carbide composite with binder metal. The most central raw material is tungsten carbide (WC). Tungsten carbide contributes to the hardness of the material. Tantalum carbide (TaC), titanium carbide (TiC) and niobium carbide (NbC) complements WC and adjusts the properties to what is desired. These three materials are called cubic carbides. Cobalt (Co) acts as a binder and keeps the material together. Carbide materials are often characterised by high compression strength, high hardness and therefore high wear resistance, but also by limited flexural strength and toughness. Carbide is used in taps, reamers, milling cutters, drills and thread milling cutters.

Surface Treatments

Bright (uncoated)		Bright finish (uncoated surface) improves chip flow in soft or non-ferrous materials and maintains sharp cutting edges in abrasive materials.
Polished Bright Surface Finish		Bright polished surface finish greatly improves chip flow in soft or gummy non-ferrous materials. Polishing facilitates chip evacuation and prevents material from sticking to cutting edges and in flutes.

Surface Coatings

Aluminium Chromium Nitride Coating (AlCrN)		The Alcrona (AlCrN) family of coatings are aluminum chromium nitride coatings mostly used for milling cutters. The two unique properties of these coatings are high hot hardness and high oxidation resistance. When used on tools for machining applications involving heavy mechanical and thermal stresses, these properties translate into superior wear resistance. Multiple levels or specific versions of these coatings are available and specific for various tools and applications.
Titanium Silicon Nitride Coating (TiSiN)		TiSiN is designed for extreme cutting conditions and high speed machining of hard materials. This multi-layered coating has a nano-composite outer layer with Si_3N_4 nano-crystallites in a crystalline TiN matrix and is engineered to protect the cutting edge from heat transfer, oxidation and abrasion. TiSiN coatings can perform well at minimum to zero lubrication conditions.
Titanium Aluminium Nitride Coating (TiAlN)		Titanium Aluminium Nitride is a multi layer ceramic coating applied by PVD coating technology, which exhibits high toughness and oxidation stability. These properties make it ideal for higher speeds and feeds, while at the same time improving tool life. TiAlN is used in drilling, tapping, and milling applications and can be suitable for use when machining without coolant.
Titanium Aluminium Nitride Coatings (X-CEED)		X-CEED type TiAlN coating, also known as Futura-Nano coating is a nanolayered coating designed for higher hot hardness and higher stress applications.
Aluminium Titanium Nitride (AlTiN)		Aluminium Titanium Nitride (AlTiN) is a nanolayered broad based coating technology which is an upgrade to the conventional TiAlN coatings and can offer superior toughness, high hot hardness and oxidation resistance.
Diamond Like Coating (DLC)		Diamond Like Coating, also known as Diamond Like Carbon (DLC) provides the highest lubricity when used on carbide tools and avoids built up edge when machining graphite or soft non-ferrous materials.

SOLID HM MILLS – FAMILIES

With our assortment of Solid HM Mills we can offer solutions to machine material for practically any WMG.

Our Solid HM Mills families:

Line	Description
S7xx	With rake angle value from 7° to 10° offers a wide usage in medium strength steel and cast steels, medium strength stainless steels, cast irons and medium strength high temperature alloys.
S2xx	With rake angle value from 3° to 4° suits best for high alloyed steels > 1200 to 1620 N/mm^2, medium strength stainless steels > 850 N/mm^2 and medium to high strength super alloys > 900 N/mm^2.
S5xx	With an negative rake angle is suited for hardened materials above 54 HRC (S501 – S511 are not in).
S6xx	With high rake angle are ideal for non-ferrous materials with one exception: S612 is only for abrasive materials such as graphite.
S8xx **S501** **S511**	Rake angle 10° suit for a multiapplication usage in mild up to medium strength steel and cast steels, mild to medium strength stainless steels, cast irons and non-ferrous materials such as aluminium and cooper and its alloys.
S9xx	Rake angle 12° makes the cutter ideal for general purposes use for softer materials, such as free machining up to medium strength steel and cast steels, cast irons, non-ferrous materials and pure titanium.

DORMER

2-skærs solid hårdmetal endefræser

Kort skærlængde, 2-skærs design med 40° spiral giver høj stivhed til fræsning af standard spor. AlCrN-belægning forbedrer ydeevnen og forlænger værktøjets levetid.

HM	N	NOF 2
	λ 40°	γ 10°
DIN 6535HA	AlCrN	DC h9
	DORMER	

Arbejdsemnets materialegruppes egnethed, startværdier for skærehastighed (m/min) og Alpha-kode. Tabeller med tilspændning pr. Tand og korrektionsfaktorer kan findes fra side 112.

3-skærs HM Endefræser, Lang serie

Lang skær længde, 3-skærs design med 40° spiral giver høj stivhed til profilfræsning af dybe vægge. AlCrN-belægning forbedrer ydeevnen og forlænger værktøjets levetid.

Arbejdsemnets materialegruppes egnethed, startværdier for skærehastighed (m/min) og Alpha-kode. Tabeller med tilspændning pr. Tand og korrektionsfaktorer kan findes fra side 112.

4-skærs Solid HM Radius Endefræser

Kort skærlængde, 4-skærs design med forskellige hjørneradier til rådighed, 40° helix med differentieret stigning for at reducere vibrationer og forbedre overfladefinish, når der fræses konturer, hvor en hjørneradius kræves AlCrN-belægning forbedrer ydeevnen. Også velegnet til at lomme, ramping, z-niveau skrubbe og spiralformet interpolation.

DORMER

5-skærs solid hårdmetal-endefræser, spåndeler og gennemgående kølemiddel

Kort skærlængde, 5-skærs design med neddrejet skaft og ulige spiral hjælper med at reducere vibrationer, især når du bruger fræseren i dynamiske fræsestrategier. AlCrN-belægning forbedrer ydeevnen og forlænger værktøjets levetid. Spåndeler og gennemgående kølevæske forbedrer spånevakuering i lommefræsning.

4-skærs endefræser i hårdmetal, ekstra lang serie

Ekstra lang skærlængde, 4-skærs design giver høj stivhed til profilfræsning af ekstra dybe vægge. AlTiN-belægning øger værktøjets levetid og forbedrer ydeevnen ved fræsning af vanskeligt bearbejdede materialer. 40° spiralen er designet til højtydende bearbejdning.

4-skærs endefræser i hårdmetal

Kort skærlængde, 4-skærs design giver høj stivhed til standard profilfræsning. AlCrN-belægning forbedrer ydeevnen og forlænger værktøjets levetid ved fræsning af vanskeligt bearbejdede materialer. 40° helix med differentiel tandeling reducerer vibrationer og maksimerer produktivitet og værktøjslevetid.

DORMER

4-skærs Solid HM Radius Endefræser

Kort skærlængde, 4-skærs design med forskellige hjørneradier til rådighed giver høj stivhed til standardprofilfræsning, når hjørneradius er påkrævet. AlCrN-belægning forbedrer ydeevnen ved fræsning af vanskeligt bearbejdede materialer. 40° spiralen med differentieret tandhøjde reducerer vibrationer og maksimerer produktiviteten.

4-skærs solid HM skrubfræser, blank

Kort skærlængde, 4-skærs med HRA-profil for at nedbryde spånerne til effektive skrubbeopgaver. AlCrN-belægning forbedrer ydeevnen og forlænger værktøjets levetid ved fræsning af vanskeligt bearbejdede materialer. 40° helix med differentiel stigning reducerer vibrationer og maksimerer produktivitet og værktøjslevetid.

S637

1 skærs HM endefræser

Normal skær længde med 1-skær giver høj ydeevne ved spor og fræsning. S637, med høj skærgeometri, er designet til højhastighedsfræsning i tyndvæggede ikke-jernholdige materialer. Poleret overflade forhindrer emneemne i at klæbe til skærekanten.

DORMER

4-skærs endefræser i hårdmetal

Kort skærlængde, 4-skærs design giver høj stivhed til standard profilfræsning. Diamantlignende belægning øger levetiden og forbedrer ydeevnen. Til fræsning af slibende materialer.

HM	N	NOF 4
	λ 40°	γ 10°

SOLID HM MILLS – FEED PER TOOTH TABLE

Feed per tooth f_z (mm/rev) depending on the working conditions it might be necessary to adjust these values ±25 %.

ONLY if plunging into solid material with a centre cutting end mill the values in this table should be considered as f_n (feed per revolution).

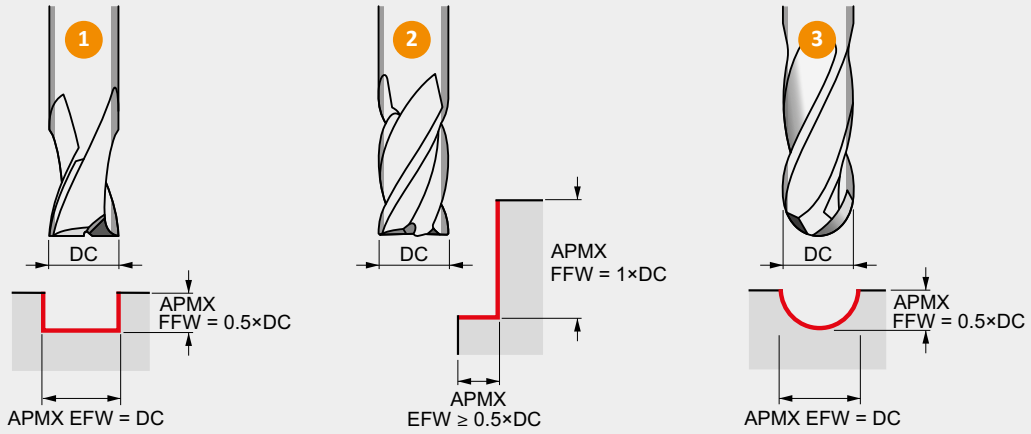

How to use this table to find the feed per tooth f_z:

1. Find your Alpha Code on the product page (example: 199K, "**K**" is the Alpha Code).
2. Find the closest diameter for your cutting application in the top row of the table.
3. Find your Alpha Code in the left column of the table.
4. The intersection (cell) of the Diameter and Alpha Code is the feed per tooth f_z.

SOLID HM MILLS – FEED PER TOOTH TABLE

Feed per tooth *IPT* or (inch/tooth) depending on the working conditions it might be necessary to adjust these values ±25 %.

ONLY if plunging into solid material with a centre cutting end mill the values in this table should be considered as *IPR* (feed in inch per revolution).

How to use this table to find the feed per tooth *IPT*:

1. Find your Alpha Code on the product page (example: 653K, "**K**" is the Alpha Code).
2. Find the closest diameter for your cutting application in the top row of the table.
3. Find your Alpha Code in the left column of the table.
4. The intersection (cell) of the Diameter and Alpha Code is the feed per tooth *IPT*.

1 Slot Milling

Correction factors for cutting speed v_c and feed per tooth f_z for slot milling operations at different depths of cut.

APMX FFW / DC	25 %	50 %	100 %	150 %
X.V	1.25	1.00	0.75	0.50
X.f	1.25	1.00	0.75	0.50

2 Shoulder Milling

Correction factors for cutting speed v_c and feed per tooth f_z for square shoulder milling with < 50 % radial immersion.

APMX EFW / DC	5 %	10 %	15 %	20 %	25 %	30 %	40 %	≥ 50 %
X.V	1.48	1.35	1.27	1.22	1.19	1.16	1.11	1.00
X.f	2.29	1.67	1.40	1.25	1.15	1.09	1.02	1.00

We recommend to avoid milling with 50 % radial immersion.

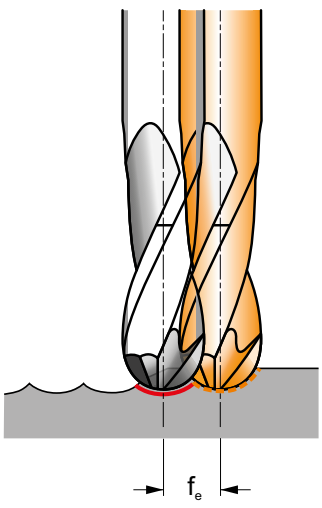

3a Plain Copy Milling (with Ball Nose Cutters)

Correction factors for cutting speed v_c for plain copy milling at different depths of cut.

APMX FFW / DC	5 %	10 %	15 %	20 %	25 %	30 %	40 %	50 %
X.V	2.29	1.67	1.40	1.25	1.15	1.09	1.02	1.00

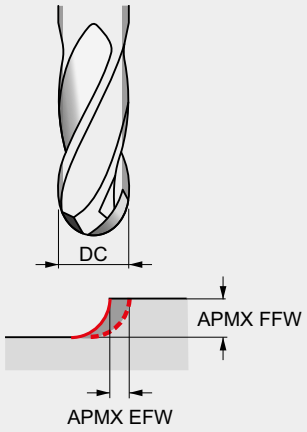

3b

Line offset f_e (step-over distance) for achieving a theorectical surface roughness R_{th}.

28		0.47	0.67	0.95	1.34	1.89	2.65	3.73	5.27

Line offset dimensions shown are Metric (mm) only.

3c

How to use this table to find the correction factor for the feed per tooth (f_z or IPT) for plain copy milling:

1. Find the closest radial immersion (APMX EFW / DC) for your cutting application in the top row of the table.
2. Find your closert axial immersion (APMX FFW / DC) for your cutting application in the left column of the table.
3. The intersection (cell) of the radial and axial immersions is the correction factor for the feed per tooth.

Example for plain copy milling:

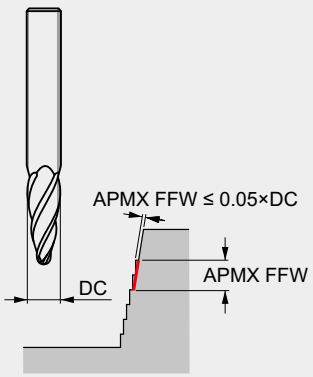

1. Applying an 8 mm ball nose cutter with a depth of cut of 0.8 mm (APMX FFW), the aim is to achieve a theoretical surface roughness of 32 µm.
2. The correction factor for cutting speed with an axial immersion of 10 % = 1.67 can be found in table 3a.
3. The step-over distance for a R_{th} of 32 µm = 1.01 mm can be found in table 3b.
4. The correction factor for feed per tooth with an axial immersion of 10 % and a radial immersion of 1.01 / 8 = 12.6 % can be found in table 3c and is in this case 2.33.

Correction factors for feed per tooth f_z for plain copy milling with a line offset < 50 % × *DC* at different of depths of cut.

APMX FFW	APMX EFW	5 %	10 %	15 %	20 %	25 %	30 %	35 %	40 %	50 %

20 %		2.87	2.08	1.75	1.56	1.44	1.36	1.31	1.28	1.25
25 %	x.f	2.65	1.92	1.62	1.44	1.33	1.26	1.21	1.18	1.15
30 %	⇨	2.50	1.82	1.53	1.36	1.26	1.19	1.14	1.11	1.09
35 %		2.40	1.75	1.47	1.31	1.21	1.14	1.10	1.07	1.05
40 %		2.34	1.70	1.43	1.28	1.18	1.11	1.07	1.04	1.02
45 %		2.31	1.68	1.41	1.26	1.16	1.10	1.05	1.03	1.01
50 %		2.29	1.67	1.40	1.25	1.15	1.09	1.05	1.02	1.00

To increase the surface quality, the tool or surface should be inclinded with a tilt angle off 10°– 15°.

SOLID HM BARREL-SHAPE MILL – FEED PER TOOTH TABLE

Feed per tooth f_z (mm/rev) depended on the working conditions it might be needed to adjust these values ±25 %.

How to use this table to find the feed per tooth f_z:

1. Find your Alpha Code on the product page (example: 121F, "**F**" is the Alpha Code).
2. Find the closest diameter for your cutting application in the top row of the table.
3. Find your Alpha Code in the left column of the table.
4. The intersection (cell) of the Diameter and Alpha Code is the feed per tooth f_z.

HSS-E-PM, HSS-E, HSS MILLS

SOLID HSS MILLS – TOOL MATERIALS NAVIGATOR

Tool materials		
High Speed Steel	HSS	A medium-alloyed high speed steel that has good machinability and good performance. HSS exhibits hardness, toughness and wear resistance characteristics that make it attractive in a wide range of applications, for example in drills and taps.
Cobalt High Speed Steel	HSS-E	This high speed steel contains cobalt for increased hot hardness. The composition of HSCo is a good combination of toughness and hardness. It has good machinability and good wear resistance, which makes it usable for drills, taps, milling cutters and reamers.
Cobalt Powder Metallurgy Steel	HSS-E PM	Sintered Cobalt High Speed Steel (HSCo powder metal) is a substrate produced using powder metallurgy technology. Tools using substrates produced by this method exhibit superior toughness and grindability.

SOLID HSS MILLS – SURFACE TREATMENTS AND COATINGS NAVIGATOR

Surface Treatments		
Bright (uncoated)		Bright finish (uncoated surface) improves chip flow in soft or non-ferrous materials and maintains sharp cutting edges in abrasive materials.
Steam Tempering		Steam tempering gives a strongly adhering blue oxide surface that acts to retain cutting fluid and prevent chip to tool welding, thereby counteracting the formation of a built-up edge. Steam tempering can be applied to any bright tool but is most effective on drills and taps.

Surface Coatings		
Alcrona Coating (Alcrona)		The Alcrona (AlCrN) family of coatings are aluminium chromium nitride coatings mostly used for milling cutters. The two unique properties of these coatings are high hot hardness and high oxidation resistance. When used on tools for machining applications involving heavy mechanical and thermal stresses, these properties translate into superior wear resistance. Multiple levels or specific versions of these coatings are available and specific for various tools and applications.
Titanium Carbon Nitride Coating (TiCN)		Titanium Carbon Nitride is a ceramic coating applied by PVD coating technology. TiCN is harder than TiN and has a lower coefficient of friction. Its hardness and toughness in combination with good wear resistance ensures that it finds its principal application in the field of milling to enhance the performance of milling cutters.

C110

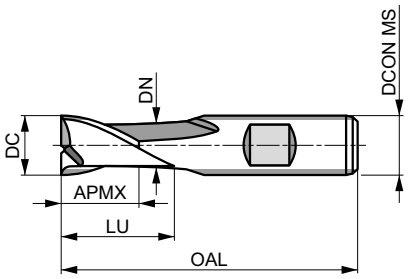

DORMER

2-skærs HSS-E-PM spor endefræser, Blank

Ekstra kort længde, 2-skærs design giver høj stivhed. Velegnet til fræsning af lave spor og rampning. Den nøjagtige diameter betyder, at værktøjet er designet til at fræse standard not spor til en P9-tolerance. Alsidig og kan bruges i mildt stål, ikke-jernholdige materialer og mellemstærk titaniumlegeringer.

HSS-E PM	N	NOF 2
	λ 30°	γ 12°
DIN 1835B	Bright	DC e8

[2] DC-tolerance h10; not ikke i P9-tolerance.

C126

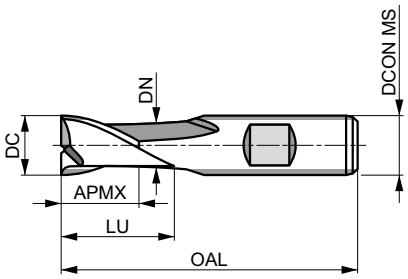

DORMER

2-skærs HSS-E-PM spor endefræser, TiCN belægning

Ekstra kort længde, 2-skærs design giver høj stivhed. Velegnet til fræsning af lave spor og rampning. Den nøjagtige diameter betyder, at værktøjet er designet til at fræse standard not spor til en P9-tolerance. TiCN-belægning øger værktøjets levetid og forbedrer ydeevnen ved fræsning af hårde og slibende materialer.

DORMER

2-skærs HSS-E-PM sporendefræserl, Blank

Medium skær længde, 2-skærs design giver høj stivhed. Velegnet til fræsning af lave spor og rampning. Den nøjagtige diameter betyder, at værktøjet er designet til at fræse standard notspor til en P9-tolerance. Alsidig og kan bruges i mildt stål, ikke-jernholdige materialer og mellemstærk titaniumlegeringer.

DORMER

2-skærs HSS-E-PM sporendefræserl, TiCN belægning

Medium skær længde, 2-skærs design giver høj stivhed. Velegnet til fræsning af lave spor og rampning. Den nøjagtige diameter betyder, at værktøjet er designet til at fræse standard notspor til en P9-tolerance. TiCN-belægning øger knivens levetid og forbedrer ydeevnen ved fræsning af hårde og slibende materialer.

HSS-E PM	N	NOF 2

2-skærs HSS-E ekstra lang sporfræser, blank

Kort skærlængde, 2-skærs design giver høj stivhed til fræsning af standard notspor til en P9-tolerance. Giver øget styrke og reducerede vibrationer i vanskeligt tilgængelige områder. Dette kan bruges i mildt stål og ikke-jernholdige materialer.

3-skærs HSS-E-PM sporendefræser, Alcrona belægning

Ekstra kort længde, 3-skærs design med en 40° spiral. Den skarpe geometri er designet til bearbejdning af milde stål, især rustfrit stål af medium til høj styrke og milde ikke-jernholdige materialer. Den nøjagtige diameter betyder, at standard not spor til P9-tolerance kan fræses. Alcrona-belægning forlænger værktøjets levetid.

4-skærs HSS-E endefræser, TiCN-belægning

Kort skærlængde, 4-skærs design til skrubfræsning. NF-profilen bryder spåner for en effektiv skrub applikation. En 30° helix reducerer vibrationer og forbedrer ydeevnen ved skrubbe. TiCN-belægning øger fræserens levetid og forbedrer ydeevnen ved fræsning af hårde og slibende materialer.

HSS-E	NF	NOF 4
	λ 30°	γ 12°
DIN 1835B	TiCN	DC k12
	DIN 844K	

Arbejdsemnets materialegruppes egnethed, startværdier for skærehastighed (m/min) og Alpha-kode. Tabeller med tilspændning pr. Tand og korrektionsfaktorer kan findes fra side 194.

HSS-E side – og planfræser

Alsidige fræsere til side – og plan fræsning og sporfræsning. Weldon-skaftet giver nøjagtig og stabil holdning, mens side – og fræsehovedet gør værktøjet godt til at skabe slidser i lodrette vægge. Den lyse overflade forhindrer, at emnet materiale klæber til værktøjets skærekanter.

HSS-E inverteret svalehalefræser

Velegnet til fræsning af almindelige inverterede svalehalespalter med valgfri 45° og 60° vinkler og Weldon-skaft for nøjagtig og stabil holdning. Den lyse overflade forhindrer, at emnet materiale klæber til værktøjets skærekanter.

DORMER

HSS-E side – og planfræser, grov tandet

Alsidig fræser designet til at fræse vandrette spor og er ideel til brede, dybe slidser. Den lyse overflade forhindrer, at emnet materiale klæber til værktøjets skærekanter.

HSS-E	NOF 16-24	λ 15°
γ 10°	Bright	DC js16
DIN 885A		

Arbejdsemnets materialegruppes egnethed, startværdier for skærehastighed (m/min) og Alpha-kode. Tabeller med tilspændning pr. Tand og korrektionsfaktorer kan findes fra side 194.

DORMER

HSS-E Sporsav fin tanddeling

Designet med en fin fortandning, ideel til smalle, dybe slidser, hvor den forskudte tandgeometri også hjælper med at kontrollere spåner under fræsning. Et meget alsidigt værktøj, der kan bruges til vandrette fræsepladser og afskedningsapplikationer. Den lyse finish forhindrer, at emnet materiale klæber til værktøjets skærekanter.

DORMER

HSS Sporsav Grov tanddeling

Designet med grov tandgeometri, ideel til tynde sektionskomponenter.Neutral tandgeometri, udover at hjælpe med at kontrollere spåner, forhindrer også gnidning, når rør og stænger skæres. Velegnet til spaltning og skæring. Dampoxidfinishen fungerer til at fastholde skæreveske og forhindre svejsning af spånværktøj.

Arbejdsemnets materialegruppes egnethed, startværdier for skærehastighed (m/min) og Alpha-kode. Tabeller med tilspændning pr. Tand og korrektionsfaktorer kan findes fra side 194.

HSS-E Endeplansfræser, TiCN Belægning

Standardborestørrelserne gør den velegnet til standard endeplansfræser og kan bruges til spalter og skæring. Fås i et stort udvalg af størrelser med diametre op til 63 mm. TiCN-belægning øger knivens levetid og forbedrer ydeevnen ved fræsning af hårde og slibende materialer.

SOLID HSS MILLS – FEED PER TOOTH TABLE

Feed per tooth f_z (mm/rev)depending on the working conditions it might be necessary to adjust these values ±25 %.

ONLY if plunging into solid material with a centre cutting end mill the values in this table should be considered as f_n (feed per revolution).

How to use this table to find the feed per tooth f_z:

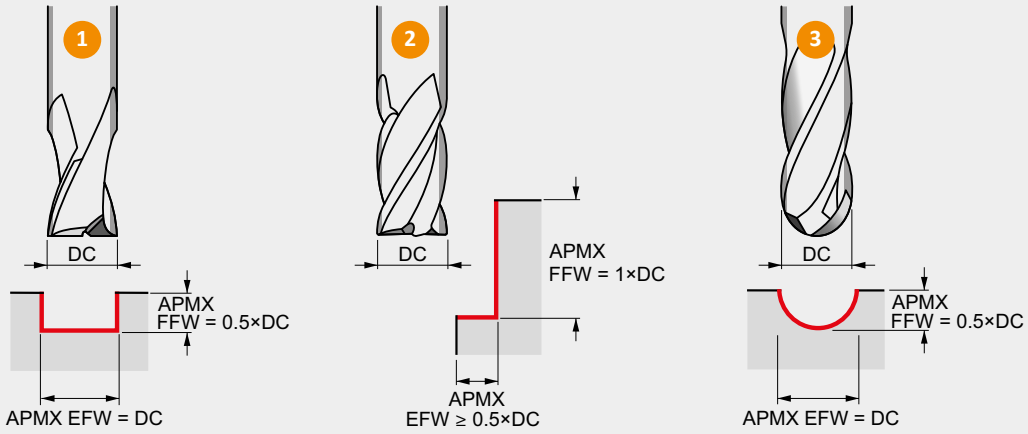

1. Find your Alpha Code on the product page (example: 48C, "**C**" is the Alpha Code).
2. Find the closest diameter for your cutting application in the top row of the table.
3. Find your Alpha Code in the left column of the table.
4. The intersection (cell) of the Diameter and Alpha Code is the feed per tooth f_z.

SOLID HSS MILLS – FEED PER TOOTH TABLE

Feed per tooth *IPT* (inch/tooth) depending on the working conditions it might be necessary to adjust these values ±25 %.

ONLY if plunging into solid material with a centre cutting end mill the values in this table should be considered as *IPR* (feed in inch per revolution).

How to use this table to find the feed per tooth *IPT*:

1. Find your Alpha Code on the product page (example: 157C, "**C**" is the Alpha Code).
2. Find the closest diameter for your cutting application in the top row of the table.
3. Find your Alpha Code in the left column of the table.
4. The intersection (cell) of the Diameter and Alpha Code is the feed per tooth *IPT*.

This table is valid for end mills and shell mills.

1 Slot Milling

Correction factors for cutting speed v_c and feed per tooth f_z for slot milling operations at different depths of cut.

APMX FFW / DC	25 %	50 %	100 %	150 %
X.V	1.25	1.00	0.75	0.50
X.f	1.25	1.00	0.75	0.50

2 Shoulder Milling

Correction factors for cutting speed v_c and feed per tooth f_z for square shoulder milling with < 50 % radial immersion.

APMX EFW / DC	5 %	10 %	15 %	20 %	25 %	30 %	40 %	≥ 50 %
X.V	1.48	1.35	1.27	1.22	1.19	1.16	1.11	1.00
X.f	2.29	1.67	1.40	1.25	1.15	1.09	1.02	1.00

We recommend to avoid milling with 50 % radial immersion.

3a Plain Copy Milling (with Ball Nose Cutters)

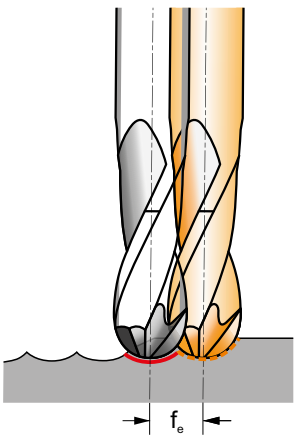

Correction factors for cutting speed v_c for plain copy milling at different depths of cut.

APMX FFW / DC	5 %	10 %	15 %	20 %	25 %	30 %	40 %	50 %
X.V	2.29	1.67	1.40	1.25	1.15	1.09	1.02	1.00

3b

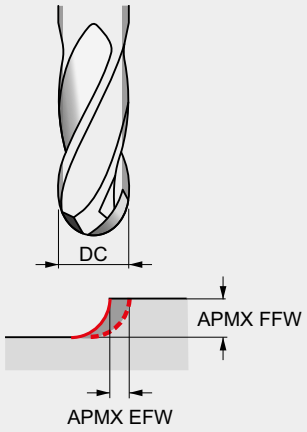

Line offset f_e (step-over distance) for achieving a theoretical surface roughness R_{th}.

18	0.38	0.54	0.76	1.07	1.52	2.13	2.99	4.21
20	0.40	0.57	0.80	1.13	1.60	2.24	3.15	4.44
22	0.42	0.59	0.84	1.19	1.68	2.35	3.31	4.66
25	0.45	0.63	0.89	1.26	1.79	2.51	3.53	4.97
28	0.47	0.67	0.95	1.34	1.89	2.65	3.73	5.27

Line offset dimensions shown are Metric (mm) only.

3c

How to use this table to find the correction factor for the feed per tooth (f_z or IPT) for plain copy milling:

1. Find the closest radial immersion (APMX EFW / DC) for your cutting application in the top row of the table.
3. Find your closest axial immersion (APMX FFW / DC) for your cutting application in the left column of the table.
4. The intersection (cell) of the radial and axial immersions is the correction factor for the feed per tooth.

Example for plain copy milling:

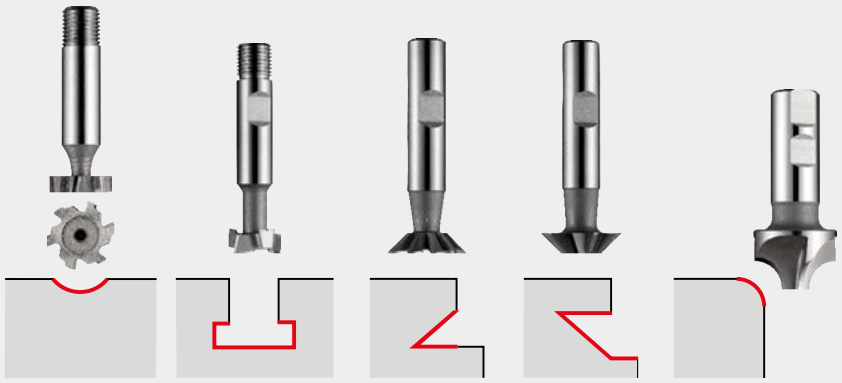

1. Applying an 8 mm ball nose cutter with a depth of cut of 0.8 mm (APMX FFW), the aim is to achieve a theoretical surface roughness of 32 µm.
2. The correction factor for cutting speed with an axial immersion of 10 % = 1.67 can be found in table 3a.
3. The step-over distance for a R_{th} of 32 µm = 1.01 mm can be found in table 3b.
4. The correction factor for feed per tooth with an axial immersion of 10% and a radial immersion of 1.01 / 8 = 12.6 % can be found in table 3c and is in this case 2.33.

Correction factors for feed per tooth f_z for plain copy milling with a line offset < 50 % × *DC* at different of depths of cut.

APMX FFW	APMX EFW	5 %	10 %	15 %	20 %	25 %	30 %	35 %	40 %	50 %
5 %		5.26	3.82	3.21	2.87	2.65	2.50	2.40	2.34	2.29
10 %		3.82	2.78	2.33	2.08	1.92	1.82	1.75	1.70	1.67
15 %		3.21	2.33	1.96	1.75	1.62	1.53	1.47	1.43	1.40
20 %		2.87	2.08	1.75	1.56	1.44	1.36	1.31	1.28	1.25
25 %	x.f	2.65	1.92	1.62	1.44	1.33	1.26	1.21	1.18	1.15
30 %	⇨	2.50	1.82	1.53	1.36	1.26	1.19	1.14	1.11	1.09
35 %		2.40	1.75	1.47	1.31	1.21	1.14	1.10	1.07	1.05
40 %		2.34	1.70	1.43	1.28	1.18	1.11	1.07	1.04	1.02
45 %		2.31	1.68	1.41	1.26	1.16	1.10	1.05	1.03	1.01
50 %		2.29	1.67	1.40	1.25	1.15	1.09	1.05	1.02	1.00

To increase the surface quality, the tool or surface should be inclinded with a tilt angle of 10°– 15°.

SOLID HSS MILLS – FEED PER TOOTH TABLE

Feed per tooth f_z (mm/rev).
Depended of the working conditions it might be needed to adjust these values ±25 %.

How to use this table to find the feed per tooth f_z:

1. Find your Alpha Code on the product page (example: 40V, "**V**" is the Alpha Code).
2. Find the closest diameter for your cutting application in the top row of the table.
3. Find your Alpha Code in the left column of the table.
4. The intersection (cell) of the diameter and Alpha Code is the feed per tooth f_z.

Feed rates for mills: C800, C801, C810, C820, C822, C825, C830, C835, C837, C831, C700, C710, D745, D747, D750, D751, D752, D753, D200, D763.

SOLID MILLS – TECHNICAL INFORMATION

HSS materials		
High Speed Steel	HSS	A medium-alloyed high speed steel that has good machinability and good performance. HSS exhibits hardness, toughness and wear resistance characteristics that make it attractive in a wide range of applications, for example in drills and taps.
Cobalt High Speed Steel	HSS-E	This high speed steel contains cobalt for increased hot hardness. The composition of HSCo is a good combination of toughness and hardness. It has good machinability and good wear resistance, which makes it usable for drills, taps, milling cutters and reamers.
Sintered Cobalt High Speed Steel	HSS-E PM	Sintered Cobalt High Speed Steel (HSCo powder metal) is a substrate produced using powder metallurgy technology. Tools using substrates produced by this method exhibit superior toughness and grindability.

	Grade	Hardness (HV10)	C (%)	W (%)	Mo (%)	Cr (%)	V (%)	Co (%)	Tool Material
HSS	M2	810 – 850	0.9	6.4	5.0	4.2	1.8	–	HSS
HSS-E	M35	830 – 870	0.93	6.4	5.0	4.2	1.8	4.8	HSCo
	M42	870 – 960	1.08	1.5	9.4	3.9	1.2	8.0	
HSS-E PM	ASP 2017	860 – 900	0.8	3.0	3.0	4.0	1.0	8.0	HSCo Powder Metal
	ASP 2030	870 – 910	1.28	6.4	5.0	4.2	3.1	8.5	
	ASP 2052	870 – 910	1.6	10.5	2.0	4.8	5.0	8.0	

HM materials		
Carbide Materials (or Hard Materials)	HM	A sintered powder metallurgy substrate, consisting of a metallic carbide composite with binder metal. The most central raw material is tungsten carbide (WC). Tungsten carbide contributes to the hardness of the material. Tantalum carbide (TaC), titanium carbide (TiC) and niobium carbide (NbC) complements WC and adjusts the properties to what is desired. These three materials are called cubic carbides. Cobalt (Co) acts as a binder and keeps the material together. Carbide materials are often characterised by high compression strength, high hardness and therefore high wear resistance, but also by limited flexural strength and toughness. Carbide is used in taps, reamers, milling cutters, drills and thread milling cutters.

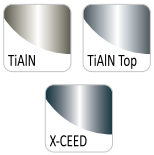

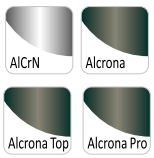

Properties	HSS materials	HM materials	K10/30F (often used for solid tools)
Hardness (HV30)	800 – 950	1300 – 1800	1600
Density (g/cm^3)	8.0 – 9.0	7.2 – 15.0	14.45
Compressive strength (N/mm^2)	3000 – 4000	3000 – 8000	6250
Flexural strength, (bending) (N/mm^2)	2500 – 4000	1000 – 4700	4300
Heat resistance (°C)	550	1000	900
E-module (kN/mm^2)	260 – 300	460 – 630	580
Grain size (µm)	–	0.2 – 10.0	0.8

The combination of hard particle (WC) and binder metal (Co) give the following changes in characteristics.

Characteristic	Higher WC content give	Higher Co content give
Hardness	Higher hardness	Lower hardness
Compressive strength (CS)	Higher CS	Lower CS
Bending strength (BS)	Lower BS	Higher BS

Grain size also influences the material properties. Small grain sizes means higher hardness and coarse grains give more toughness.

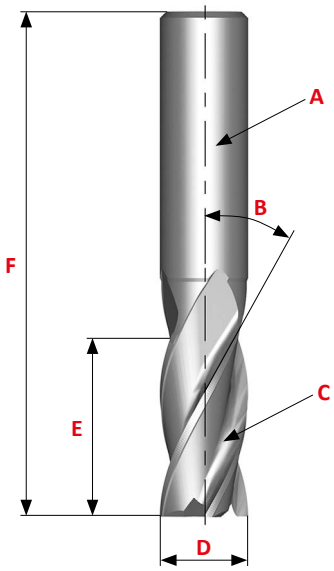

Surface Treatments		
Bright (uncoated)		Bright finish (uncoated surface) improves chip flow in soft or non-ferrous materials and maintains sharp cutting edges in abrasive materials.
Steam Tempering		Steam tempering gives a strongly adhering blue oxide surface that acts to retain cutting fluid and prevent chip to tool welding, thereby counteracting the formation of a built-up edge. Steam tempering can be applied to any bright tool but is most effective on drills and taps.

Surface Coatings		
Titanium Carbon Nitride Coating (TiCN)		Titanium Carbon Nitride is a ceramic coating applied by PVD coating technology. TiCN is harder than TiN and has a lower coefficient of friction. Its hardness and toughness in combination with good wear resistance ensures that it finds its principal application in the field of milling to enhance the performance of milling cutters.
Titanium Aluminium Nitride Coatings (TiAlN, TiAlN-Top & X-CEED)		Titanium Aluminium Nitride is a multi layer ceramic coating applied by PVD coating technology, which exhibits high toughness and oxidation stability. These properties make it ideal for higher speeds and feeds, while at the same time improving tool life. TiAlN is used in drilling, tapping, and milling applications and can be suitable for use when machining without coolant. TiAlN-Top coating is the same as TiAlN but with a post-coating process designed to smooth out imperfections, enhance chip flow and reduce built up edge. X-CEED type TiAlN coating, also known as Futura-Nano coating is a nanolayered coating designed for higher hot hardness and higher stress applications.
Aluminium Titanium Nitride Coating (AlTiN)		Aluminium Titanium Nitride (AlTiN) is a nanolayered broad based coating technology which is an upgrade to the conventional TiAlN coatings and can offer superior toughness, high hot hardness and oxidation resistance.
Alcrona Coatings (AlCrN, Alcrona, Alcrona-Top & Alcrona-Pro)		The Alcrona (AlCrN) family of coatings are aluminium chromium nitride coatings mostly used for milling cutters. The two unique properties of these coatings are high hot hardness and high oxidation resistance. When used on tools for machining applications involving heavy mechanical and thermal stresses, these properties translate into superior wear resistance. Multiple levels or specific versions of these coatings are available and specific for various tools and applications.
Titanium Silicon Nitride Coating (TiSiN)		TiSiN is designed for extreme cutting conditions and high speed machining of hard materials. This multi-layered coating has a nano-composite outer layer with Si3N4 nano-crystallites in a crystalline TiN matrix and is engineered to protect the cutting edge from heat transfer, oxidation and abrasion. TiSiN coatings can perform well at minimum to zero lubrication conditions.

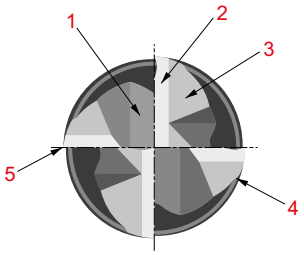

Surface treatment/Coating properties examples

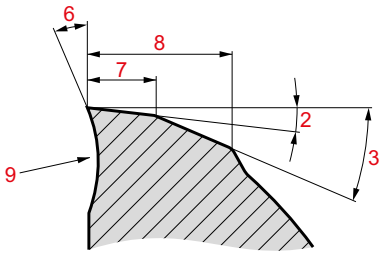

Surface Treaments	Color	Coating material	Hardness (HV)	Thickness (µm)	Coating structure	Frict. coeff. against steel	Max. appl. temp. (°C)
 ST	Dark grey	Fe_3O_4	400	max. 5	Conversion into the surface	–	550
 TiCN	Blue grey	TiCN	3000	1 – 4	Multi-layer gradient	0.4	500
 TiAlN	Black grey	TiAlN	3300	3	Nano structured	0.3 – 0.35	900
 AlCrN	Blue grey	AlCrN	3200	–	Mono-layer	0.35	1100

2 Primary Relief Angle
3 Secondary Relief Angle
4 Heel
5 Cutting Edge
6 Rake Angle
7 Width of Primary Relief Land
8 Width of Secondary Relief Land
9 Undercut Face

Features Of The End Mill – Choosing The Number Of Flutes *NOF*

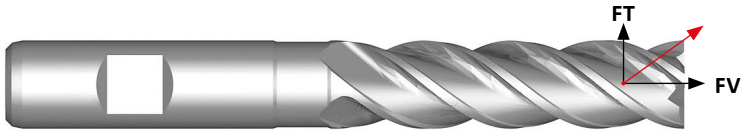

Number of flutes should be determined by:
- Milled material
- Dimension of workpiece
- Milling conditions

2 Flutes	3 Flutes	4 Flutes (or multi-flutes)
		
LOW ← **DEFLECTION STRENGTH** → **HIGH**		
BIG ← **CHIP SPACE** → **SMALL**		
• Large chip space • Easy chip ejection • Good for slot milling • Good for heavy duty milling • Less rigidity due to small section area • Lower quality surface finish	• Chip space almost as large as for 2 flutes • Larger section area – higher rigidity than 2 flutes • Improved surface finish	• Highest rigidity • Largest section area – small chip space • Gives best surface finish • Recommended for profiling, side milling and shallow slotting

Features Of The End Mill – Helix Angle

Increasing the number of flutes makes the load on the single tooth more homogeneous and consequently, this allows for a better finish. But with a high helix angle, the load *FV* along the cutter axis is increased too.

A high *FV* can give:
- Load problems on the spindle bearings
- Cutter movement along the spindle axis. To avoid this problem it is necessary to use Weldon or better Mechanical or Hydraulical Toolholder.

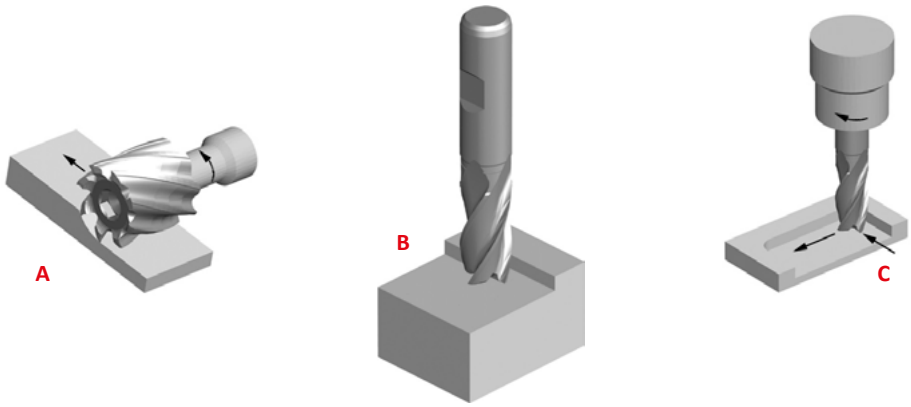

Generelle tips om fræsning

Fræsning er en fremgangsmåde til generering af bearbejdede overflader ved gradvis fjernelse af en forudbestemt mængde af materiale eller materiel fra emnet ved en relativt langsom bevægelse af en fræser, som roterer ved en forholdsvis høj hastighed. Det karakteristiske træk ved fræseprocessen er, at hver fræser tand fjerner sin andel af emnet i form af små individuelle spåner.

Type af fræsere

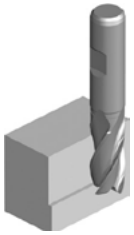

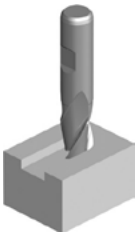

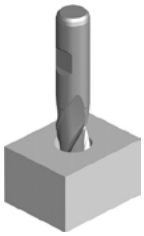

De tre grundlæggende fræseoperationer er vist nedenfor: (A) valsefræsning; (B) planfræsning; (C) pindfræsning.

Ved valsefræsning er værktøj rotationsakse parallelt med den bearbejdede overflade. Fræseren har en række skær langs periferien. Valsefræsere kan have lige eller spiralformede tænder, der genererer en plant eller skrå snit.
Planfræsere er monteret på en aksel, hvis rotationsakse er vinkelret på den bearbejdede overflade. det riflede overflade skabt af skærene er placeret på periferien af fræseren.
I fræsemaskinen rotationsakse lodret til emnet. Den kan vippes til maskinen i skrå plan. Pindfræseren har normalt skærekanter på både endefladen og periferien.

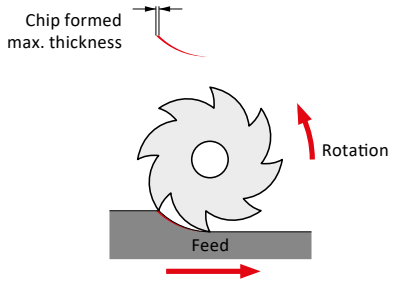

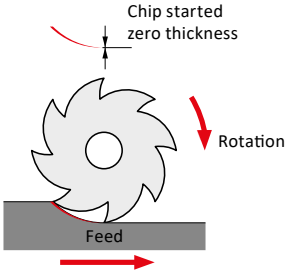

Forskellige bearbejdning med endefræsere

MRR anbefalingen er stærkt relateret. For hver anbefaling har vi valgt en anden MRR der stiger med indgrebet af skæret på emnet. Den seneste Dormer katalog blev produceret med enkle ikoner, der viser de forskellige anbefalinger

Sidefræsning	Planfræsning	Sporfræsning	Boring	Ramping
				
Den radiale indgreb skal være mindre end 0.25 af diameteren af endefræseren.	Radial spåndybde kan ikke overstiger 0.9 gange diameter. Axial indgreb skal være mindre end 0.1 gange diameter.	Beabejdningen af spor og not. Svare til fræserens diameter.	Det er kun muligt at bore med en endefræser med skær i centrum. Ved boring skal tilspænning -50 %.	Både aksial og radial fræsning ind i emnet.

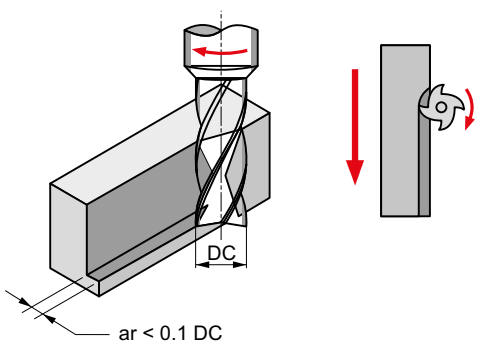

Milling Effectively

Types Of Cuts
Climb Milling Versus Conventional Milling

CLIMB MILLING	CONVENTIONAL MILLING
	
In climb milling, the cutter revolves in the same direction as the table feed. The tooth meets the work at the top of the cut, producing the thickest part of the chip first. In horizontal applications the resultant force created by climb milling can act as a clamping force, acting towards the machine table. It is important to make sure that the machine tool has no leadscrew backlash. Normally climb milling improves product surface finish and increases tool life.	In conventional milling, the cutter revolves opposite to the direction of table feed. Therefore the width of the chip starts at zero and increases to a maximum at the end of the cut. This can lead to accelerated tool wear under some conditions. Conventional milling may be advantageous when milling hot rolled steel, surface hardened and steels with a surface scale.

PERIPHERAL (CYLINDRICAL, SLAB) MILLING

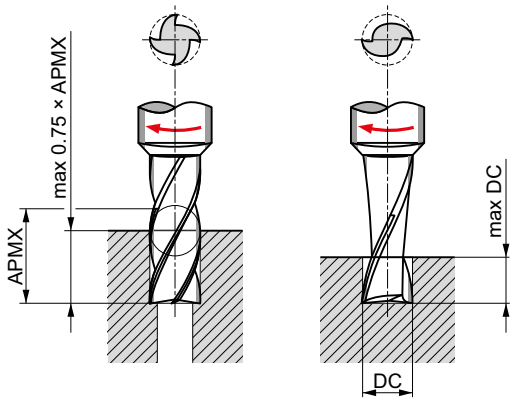

Peripheral Milling: The milling of a surface which is parallel to the end mill axis.

The radial depth of cut should be less than 0.1 of the diameter of the mill: ar < 0.1 *DC*.

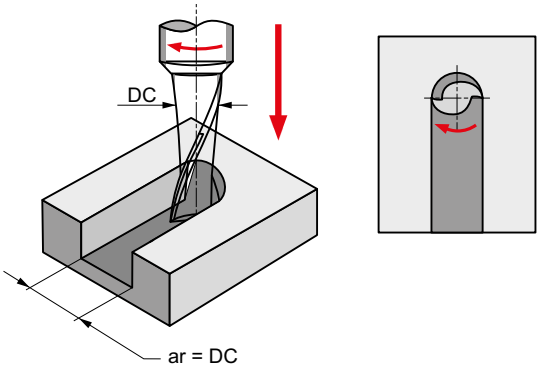

Plunge Milling

The direct movement between the workpiece and the centre line of the end mill when the end mill sinks directly into the workpiece.

In order to be able to “drill,” i.e. mill with axial feed, an end mill must have an end face cutting edge that goes all the way to the centre. An example of such a solid drilling operation is keyway milling in the middle of a shaft.
In boring, the depth of a hole may be up to 75 % of the cutting edge length. In solid drilling, however, it should not exceed 0.5 – 1.0 *DC*.

Slot Milling

The radial depth of cut is equal to the diameter of the mill: *ar* = *DC*.
All slotting applications are a combination of conventional and climb milling. Refer to adjacent section.

End Mill Selection

Utilize the shortest possible tool available for the application with the largest diameter permissible and the shortest flute length as depth of cut allows. Extra length end mills have excessive overhang, thus a reduction in feed up to 25 % may be required. Stub length end mills, due to their short overall and flute length, have more rigidity, thus an increase in feed rates of up to 25 % may be required.

Speeds

Solid Carbide end mills must be run at higher speeds than High Speed Steel end mills. Many times, lighter cuts at higher speeds can improve the finish of the workpiece.
When the application is a slotting cut, the speed should be reduced by approximately 20 %. Speeds should be decreased when milling hard or tough materials or when taking heavy cuts. Speeds should be increased when milling softer materials or when taking lighter cuts. Speeds should also be increased for finishing cuts.

Coolants

Coolants are recommended when milling mild steel and high temperature alloys. The purpose of the coolant media is to direct the chips away from the cutting tool and workpiece. This prevents damage to the cutting edges due to recutting the chips. When machining titanium, coolant flow must be heavy and directed at the area of cut to prevent overheating and assist in chip removal.

Milling Terminology/Operating Formulas

The following terms and formulas can be used to determine the appropriate operating parameters.

Formulas (Metric)			Terms			Formulas (Imperial)
$v_c = \frac{n \times DC \times \pi}{1000}$	v_c	(m/min)	**Cutting speed**	SFM	(ft/min)	$SFM = \frac{RPM \times DC \times \pi}{12}$
$n = \frac{v_c \times 1000}{DC \times \pi}$	n	(rev/min)	**Spindle speed**	RPM	(rev/min)	$RPM = \frac{SFM \times 12}{DC \times \pi}$
$V_f = f_z \times z \times n$	V_f	(mm/min)	**Feed rate**	IPM	(in/min)	$IPM = IPT \times T \times RPM$
$f_z = \frac{V_f}{z \times n}$	f_z	(mm/tooth)	**Feed per tooth**	IPT	(in/tooth)	$IPT = \frac{IPM}{T \times RPM}$
$Q = \frac{V_f \times APMX\ FFW \times APMX\ EFW}{1000}$	DC	(mm)	**Cutting diameter**	DC	(in)	$MRR = IPM \times DOC \times WOC$
	z	(–)	**Number of teeth**	T	(–)	
	APMX FFW	(mm)	**Depth of cut**	DOC	(in)	
	APMX EFW	(mm)	**Width of cut**	WOC	(in)	
	Q	(cm^3/min)	**Metal removal rate**	MRR	(in^3/min)	

Problem	Solution	
Chipping of the Cutting Edge	• Try air blow or coolant • Reduce depth of cut • Check amount of wear on collet • Reduce feed per tooth • If wet cutting, change to dry cutting	• Check tool runout • Improve the stability of the work-holding
Extreme Flank Wear	• Use coated end mill • If conventional milling, change to climb • If using water soluble cutting fluid, change to non-water soluble cutting fluid • Use a tool with a larger helix angle	• If conventional milling, change to climb
Vibration/Chattering	• Use larger diameter end mill • Increase feed per tooth • Increase helix angle • Reduce length of flutes or overhang • Reduce cutting speed	• Check or change the holder • Increase number of flutes • Tighten chuck or use stronger chuck
Deflection	• Reduce depth of cut • Increase feed per tooth • Increase helix angle • If using water soluble cutting fluid, change to non-water soluble cutting fluid	• Use larger diameter end mill • Reduce length of flutes or overhang • If using 2-flute type, change to 4-flute type • If climb milling, change to conventional milling
Poor Surface Finish	• Reduce end mill runout • Increase cutting speed • Reduce feed per tooth • Increase helix angle • Increase number of flutes	• Increase volume of air or cutting fluid • Reduce depth of cut • If dry cutting, change to wet cutting
Waviness	• Reduce helix angle • Check end mill runout • Reduce depth of cut • Check or change the holder	
End Mill Fracturing	• Reduce depth of cut • Reduce feed per tooth • Reduce length of flutes or overhang • If chip jamming occurs, reduce the number of flutes	
Poor Chip Disposal	• Use air blow • Reduce depth of cut • Reduce feed per tooth • Reduce the number of flutes • Increase volume of air or cutting fluid	• Increase cutting speed
Burring Workpiece Chipping	• Reduce helix angle • Reduce feed per tooth • Reduce depth of cut	
Chip Welding	• Use coolant • Use coated end mill • Increase volume of cutting fluid • Increase helix angle

CARBIDE ROTARY BURRS

Our range of carbide rotary burrs is a high quality and comprehensive program. This includes a variety of designs and shapes to offer an ideal option for the majority of applications in all major industry segments.

FEATURES AND BENEFITS

- The combination of premium grade materials for both the shank and head, with the precise production process, results in the creation of a consistent and secure program of tools.
- Each CUT STYLE has been designed to be the first choice for high performance machining in the relevant material. This includes steels (ST CUT), stainless steels (VA CUT), non-ferrous materials and plastics (ALUMINIUM CUT), superalloys (AS CUT), fibreglass and composite materials (GRP CUT), and general machining (DC CUT).

SHANK

- Toughened and hardened steel shanks
- Provides rigidity and strength
- Prevents bending and reduces vibration, resulting in improved tool life
- Ground to h6 (carbide) and h7 (steel) for improved holding

BRAZING

- Special brazing elements provide excellent braze strength
- Excellent impact strength to withstand high forces
- Able to withstand higher temperature without failing

CUT STYLES

ST CUT

First choice for high performance machining of **Steels**

- Material specific chip breaker design for higher machining output on steel parts
- Positive geometry, ensures smooth surface finish
- Creates less temperature which helps increase tool life

VA CUT

First choice for high performance machining of **Stainless steels**

- Sharp cutting geometry, reducing the onset of work-hardening
- Increases metal removal rate

ALUMINIUM CUT

First choice for **Non ferrous materials and Plastics**

- High helix and large flute volume for rapid metal removal

CARBIDE ROTARY BURRS

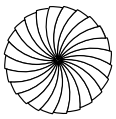

BALL NOSE GEOMETRY

- Skip flute grinding
- Increased strength at the centre
- Reduced chance of swarf congestion
- Improved cutting action closer to the centre

Skip

Normal

TiAlN COATING

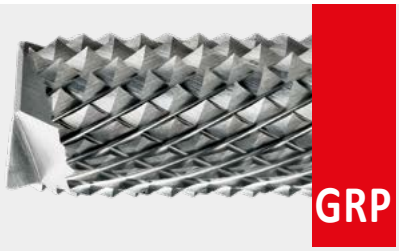

- Increased tool life in difficult conditions
- Reduced friction improves swarf evacuation
- Helps resist “built-up edge” common with cutting tools with small flute volumes

AS CUT

First choice for **Superalloys**

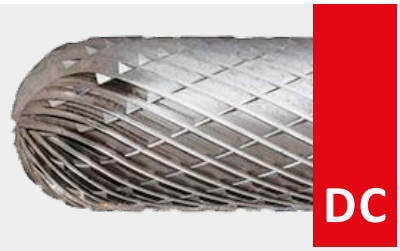

- Ergonomic
- High quality surface finish
- Fast and smooth cutting action

GRP CUT

First choice for **Fibreglass and Composite materials**

- Available with Drill Point and End Mill styles
- Designed to reduce splintering and improve entry and exit surface quality

DOUBLE CUT

First choice for **General machining**

- Improves ease of control
- Increases metal removal rate

CARBIDE ROTARY BURRS

FOR BOLT REMOVAL

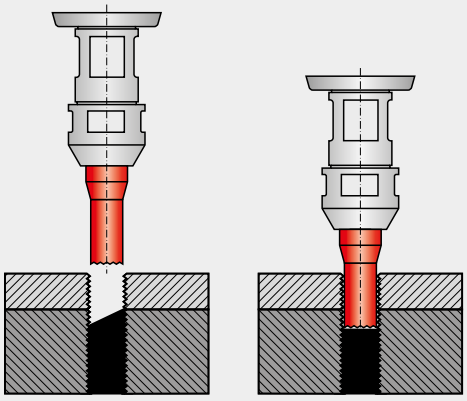

A specially designed range of burrs to prepare the surface of broken bolts to improve drill location and prevent damaging the threaded hole and component.

FEATURES AND BENEFITS

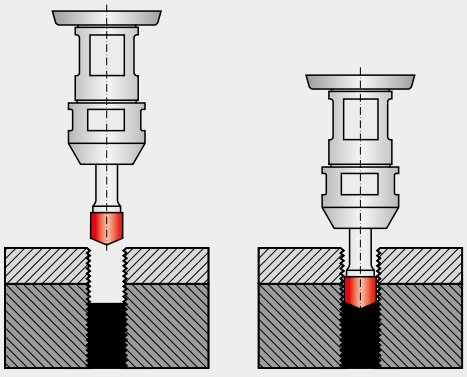

- Specific diameters and cutting lengths to suit various thread diameters
- Long reach and tapered shanks for easy access
- Developed cutting geometry for machining high tensile materials
- Reduces potential damage to existing threaded holes
- Improves drill location, ensuring damaged bolt is drilled on centre
- Prevents potential scrappage of component
- Highly consistent quality

OPERATIONS

1

2

CUT STYLES

PLAIN CYLINDER WITH END CUT

150° COUNTERSINK

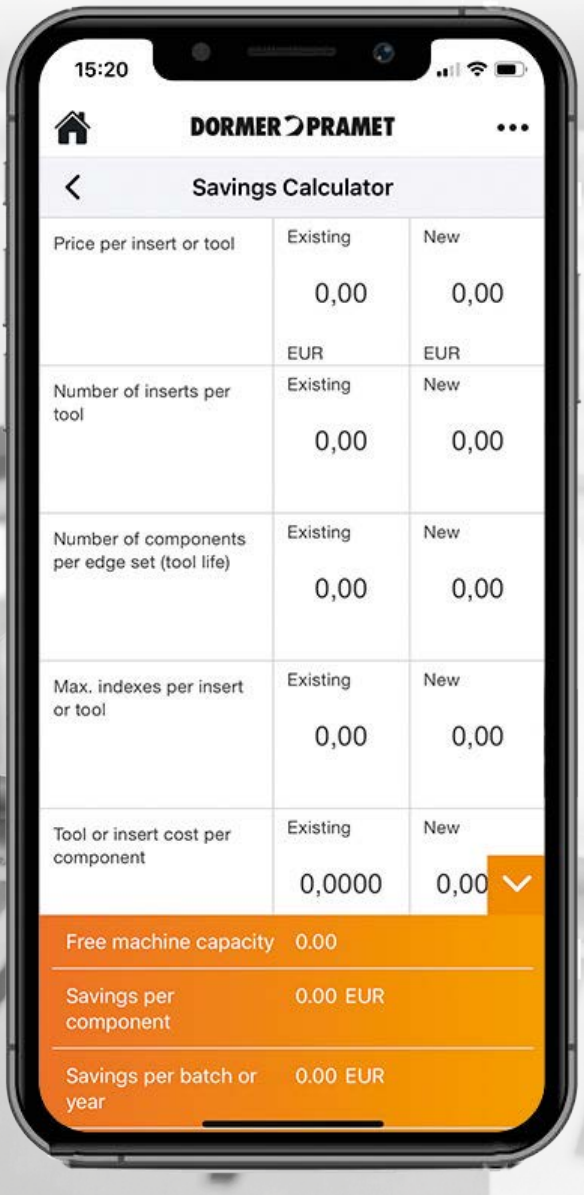

HOW TO USE THE TOOLS

- Choose the correct size burr for the broken bolt
- Use a right-handed die grinder
- Ensure the burr is perpendicular to the broken bolt
- Grind the broken surface flat – Operation ①
- Grind into the prepared surface to form a countersink location at the centre point of the bolt – Operation ②

DORMER PRAMET

POCKET SAVER

Our machining calculator allows you to measure the savings based on different products and applications. A useful pocket-sized tool, which will help keep cash in your pockets! **Simply Reliable.**

HM materials		
Carbide Materials (or Hard Materials)	HM	A sintered powder metallurgy substrate, consisting of a metallic carbide composite with binder metal. The most central raw material is tungsten carbide (WC). Tungsten carbide contributes to the hardness of the material. Tantalum carbide (TaC), titanium carbide (TiC) and niobium carbide (NbC) complements WC and adjusts the properties to what is desired. These three materials are called cubic carbides. Cobalt (Co) acts as a binder and keeps the material together. Carbide materials are often characterised by high compression strength, high hardness and therefore high wear resistance, but also by limited flexural strength and toughness. Carbide is used in taps, reamers, milling cutters, drills and thread milling cutters.

ROTARY BURRS – SURFACE AND TREATMENTS COATINGS NAVIGATOR

Surface Treatments		
Bright (uncoated)		Bright finish (uncoated surface) improves chip flow in soft or non-ferrous materials and maintains sharp cutting edges in abrasive materials.

Surface Coatings		
Titanium Aluminium Nitride Coating (TiAlN)		Titanium Aluminium Nitride is a multi layer ceramic coating applied by PVD coating technology, which exhibits high toughness and oxidation stability. These properties make it ideal for higher speeds and feeds, while at the same time improving tool life. TiAlN is used in drilling, tapping, and milling applications and can be suitable for use when machining without coolant.

HM Fil – Cylinder med endeskær, form B, TiALN belægning

DC dobbeltskåret fil med tæt anbragte skær til indviklet udskæring, metalgravering og svejsningsklargøring. Hårdmetaldesign til skærediameter op til 6 mm; over 6 mm hårdmetalhoved med hærdet og hærdet stålskaft. TiALN-belægning for øget værktøjslevetid, reduceret friktion og forbedret spånevakuering.

HM | B | TiAlN | DC | DORMER

Arbejdsstykke materiale gruppe egnethed. Anbefalet driftshastighed (RPM) på side 229.

HM fil – Spidsformet, type G, TiALN belægning

DC dobbeltskåret fil med tæt anbragte skær til indviklet udskæring, metalgravering og svejsningsklargøring. Hårdmetaldesign til skærediameter op til 6 mm; over 6 mm hårdmetalhoved med hærdet og hærdet stålskaft. TiALN-belægning for øget værktøjslevetid, reduceret friktion og forbedret spånevakuering.

Gode råd til brug af HM File

HM file har en bred vifte af applikationer til klassificering i mange forskellige materialer.
De bruges normalt i håndholdt, trykluftværktøj.

Egenskaber og fordele

1. Hærdede og hård stålskaft giver høj stivhed og forhindrer bøjning og vibration.
2. Nøjagtig slebet skaft for sikker opspænding.
3. Speciel loddemetode, der modstår høje temperaturer og tryk.
4. Den universelle Double Cut geometri virker i en række forskellige materialer og applikationer.
5. Der findes materialeanpassede geometrier til stål (ST), aluminium (AL) og glasfiber (GRP).
6. TiAlN belagte file er tilgængelige til slidende materialer.
7. De kugleformede file har en overlappende sporform.
8. Det gør det muligt for filen at skære hele vejen ind i midten af kroppen med en forbedret effekt og reduceret tilstopningsrisiko som følge heraf.

Springe	Normal
	

Sikkerhed først

1. Højhastighedsværktøjer er farlige og kan forårsage skade, hvis de anvendes forkert.
2. Tag altid stikket ud af trykluften, når du skifter filen.
3. Kontroller filtilstanden og anvend helst filtyper, der giver mindre vibrationer.
4. Brug altid passende beskyttelsesudstyr og hold dig væk fra andre, der arbejder ved siden af dig.

Beskyttelsesudstyr skal altid anvendes!

ROTARY BURRS – GENERAL HINTS

Anbefalinger

- Det er vigtigt at kontrollere maskinens lejer og smøring regelmæssigt.
- Rengør altid klemmemøtrikken, hylster og holder, når du skifter fil.
- Undgå slag og højt tryk på filen.
- Undgå at overophede filen.
- Kør ikke filen for dybt ind i materialet eller klem det ind i et hjørne eller spor.

Fejlsøgning HM File

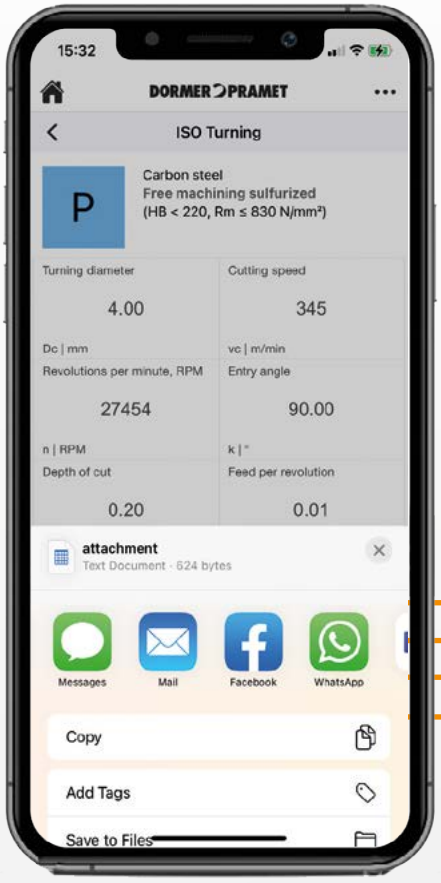

Problemer	Årsag
Tænderne fliser ud	For langsom hastighed kan få filen til at hoppe
	Ekscentricitet på grund af slidt spindel, muffe eller leje
	For dyb indgreb eller filen sætter sig fast
Tænderne tilstopper	For lang sporlængde eller total længde
	Forkert valg af geometri til arbejdsmaterialet
For hurtig slitage	Arbejder med for høj hastighed
	Ekscentricitet på grund af slidt spindel, muffe eller leje
Fræsehovedet løsner sig	Overdreven hastighed, kan forårsager overophedning
	For lang indgrebstid kan forårsage overophedning

THREAD MILLS – TOOL MATERIALS AND SURFACE COATINGS NAVIGATOR

HM materials		
Carbide Materials (or Hard Materials)	HM	A sintered powder metallurgy substrate, consisting of a metallic carbide composite with binder metal. The most central raw material is tungsten carbide (WC). Tungsten carbide contributes to the hardness of the material. Tantalum carbide (TaC), titanium carbide (TiC) and niobium carbide (NbC) complements WC and adjusts the properties to what is desired. These three materials are called cubic carbides. Cobalt (Co) acts as a binder and keeps the material together. Carbide materials are often characterised by high compression strength, high hardness and therefore high wear resistance, but also by limited flexural strength and toughness. Carbide is used in taps, reamers, milling cutters, drills and thread milling cutters.

Surface Coatings		
Alcrona coatings (Alcrona Pro)	Alcrona Pro	The Alcrona (AlCrN) family of coatings are aluminium chromium nitride coatings mostly used for milling cutters. The two unique properties of these coatings are high hot hardness and high oxidation resistance. When used on tools for machining applications involving heavy mechanical and thermal stresses, these properties translate into superior wear resistance. Multiple levels or specific versions of these coatings are available and specific for various tools and applications.

J200

DORMER

Massiv hårdmetal gevindfræser med forsænker, metrisk

Universelt højtydende værktøj til bearbejdning af samme eller større diametre end TDZ med samme stigning. Venstre eller højre, gennem eller bundhuller næsten ned til bunden. Med 60° undersænker til affasning i en enkelt bearbejdningscyklus. Alcrona Pro belagt til det bedste bearbejdningsresultat i en bred vifte af materialer.

Arbejdsemnets materialegruppes egnethed, startværdier for skærehastighed (m/min) og Alpha-kode. Tabeller med tilspændning pr. Tand og korrektionsfaktorer kan findes fra side 309.

Generelle informationer om gevindfræsning

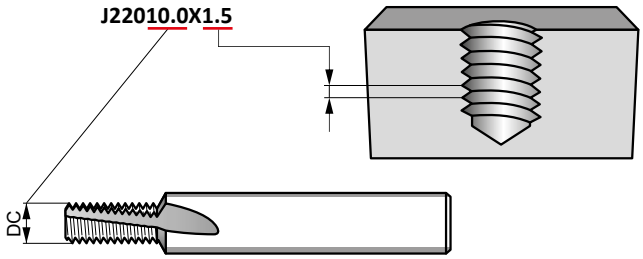

1. Gevindfræsning er en proces med at fremstille et gevind ved den cirkulære intepolering af en fræser med en specifik gevindgeometribund omkring sin periferi.
2. For at kunne bruge en gevindfræser er det nødvendigt at have en CNC-maskine, der kan køre cirkulære program.
3. De fleste moderne styrede maskiner har maskincyklus til gevindfræsning.
4. Læs maskinens manual eller kontakt maskinfabrikanten for at få oplysninger.

Egenskaber og fordele

1. Gevindfræsning giver højere pålidelighed, og gevindfræseren har længere levetid.
2. Gevindfræseren producerer små spåner, der ikke påvirker gevindprocessen.
3. Toleransjusteringer kan foretages netop gennem programmering.
4. Gevindfræsning giver fuld gevindform helt ned til bunden af hullet.
5. Gevindfræsning kan bruges i mange forskellige materialer.
6. Den samme fræser kan bruges til mange dimensioner, så længe stigningen er den samme.
7. Både højre og venstre gevind kan skæres med samme fræser.
8. Nogle af gevindfræserne kan fase hullets indgang (J200, J205, J260).

Valg af værktøj

Gevindfræseren har en varekode bestående af type, diameter *DC* og stigning *TP.*
Varekoden bruges ved bestilling af dit værktøj.
Brug altid kataloget til at være sikker på at bestille det rigtige værktøj.

Denne gevingfræser kan bruges
til gevind ≥ M12×1.5
(M14×1.5, M18×1.5 etc.)

Programmering med Rprg

- Brug altid radiuskompensation for at forenkle tolerancejusteringer.
- Rprg-værdien er startværdien af en ny fræser og er skrevet på fræseskaftet. Det skal indtastes i værktøjsprogrammet.
- Rprg er baseret på trådens teoretiske nullinje, hvilket betyder, at hvis du bruger Rprg, risikerer du aldrig overmål uden at gevindet får normal tolerance.
- Dette betyder, at du kan ændre gevindets dimensioner gennem små justeringer af programkoordinaterne.

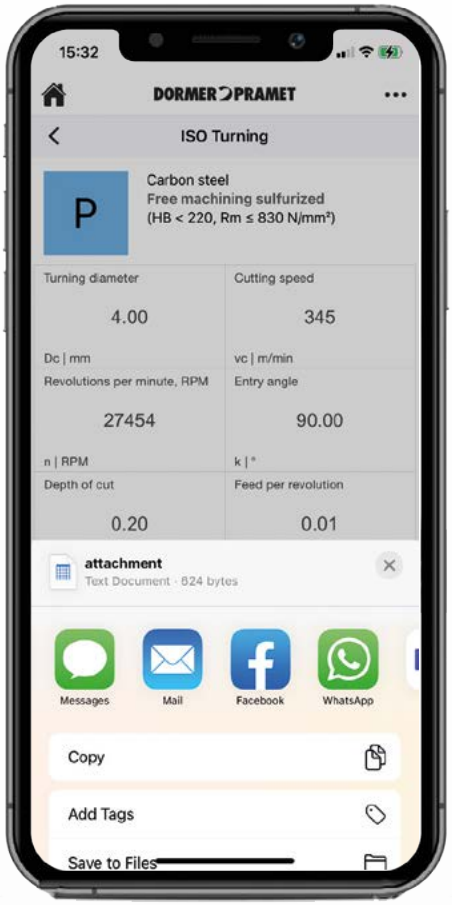

Anbefalinger

- Brug altid anbefalede skæredata.
- Brug altid den anbefalede borediameter for gevindet, samme som for en gevindtap.
- Start altid med gevindfræserens Rprg-værdi og juster tolerancen om nødvendigt.
- Kontroller altid det første gevind med en gevindprøvedorn og juster om nødvendigt radiusen. Radien kan justeres 2 til 3 gange, før fræseren er slidt.
- Hvis du kører tørt, anbefaler vi at du bruger trykluft til at fjerne spåner.
- Ved fræsning i hårde materialer skal du bruge to eller tre overløb.

FORCE AD11 Square Shoulder Mill with Internal Coolant

90° end and shell mills utilising positive AD.. 11 style insert with APMX of 9 mm. Suitable for face, shoulder, slot, helical, trochoidal, ramping and plunge milling. Available in cylindrical, Weldon, Morse taper, modular and arbor (with differential tooth pitch) style, in Ø16 up to Ø125 mm. Body treated for longer tool life.

▼▼▼	Finishing – very good surface quality
▼▼	Medium machining – good surface quality
▼	Roughing – unlimited surface roughness
●	Suitable for stable working conditions
●	Suitable for unstable working conditions
●	Suitable for heavy working conditions

Milling Operations

	Face Milling
	Shallow shoulder milling
	Deep shoulder milling
	Shallow slot milling
	Deep slot milling

	T-slot Milling
	Contoured Surfaces (copy milling)
	Chamfer Milling
	Helical interpolation
	Helical interpolation in a pre-drilled hole

	Plunge Milling
	Progressive Plunging
	Ramping
	Rear face milling

Shanks

	Shell mill DIN 8030
	Shell mill DIN 8030 – helical mill
	Shell mill DIN 8030 – disc mill
	DIN 1835A Cylindrical Shank

	DIN 1835B Weldon Shank
	Morse shank DIN 228-1
	Polygon shank coupling ISO 26623-1
	Arbor DIN 2080-1

	Arbor DIN 69871-1
	Arbor MAS BT (JIS-B-6339)
	Threaded coupling

INDEXABLE MILLS – ICONS OVERVIEW

Features

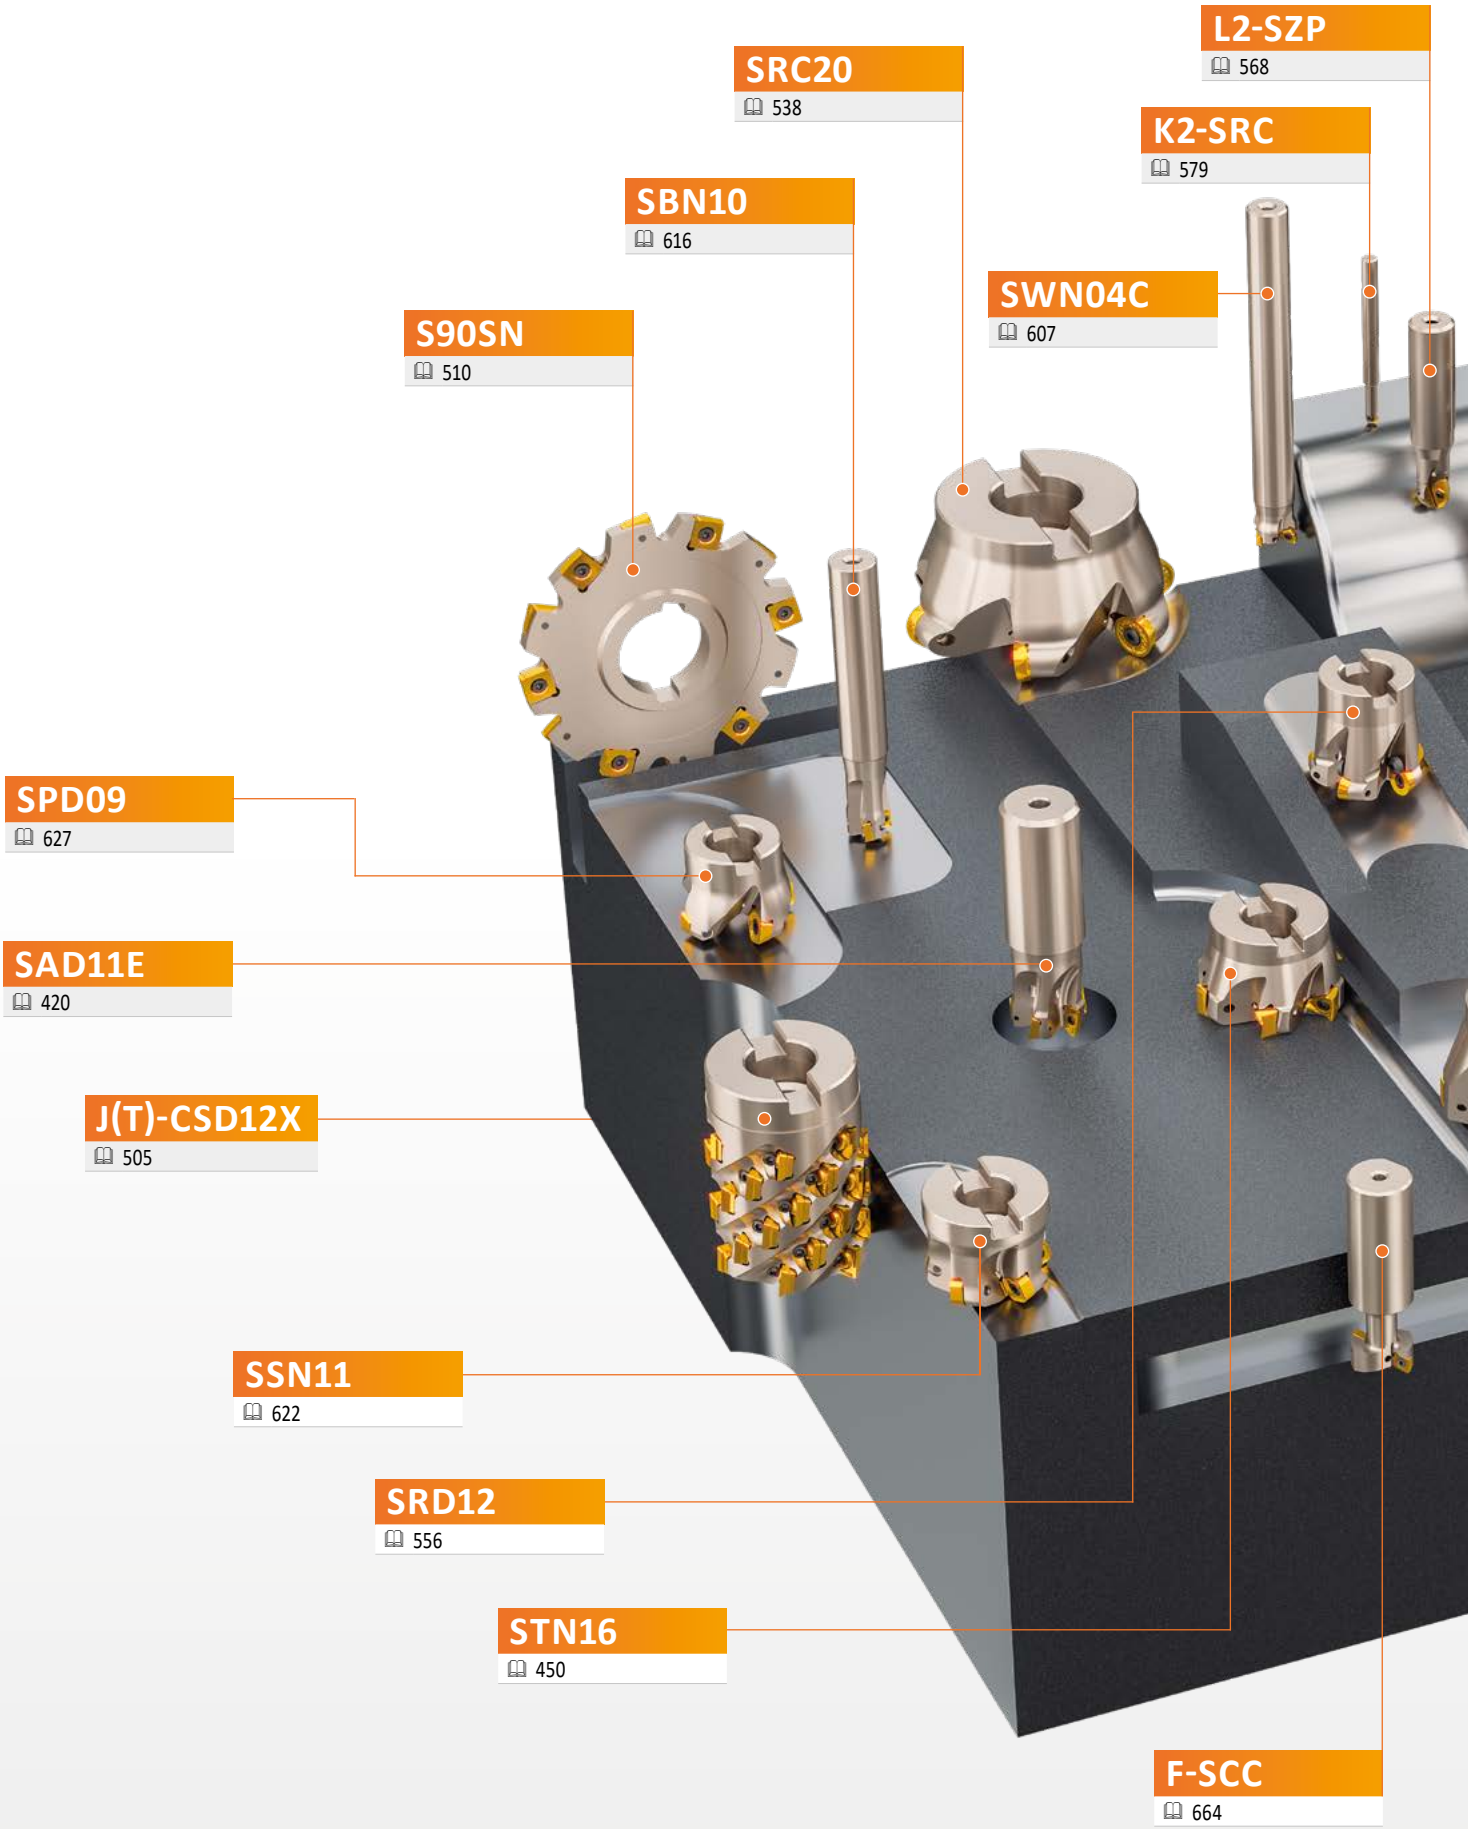

First choice	
Heavy working conditions	
High Feed Cutting	
Insert with Wiper geometry	
Long overhang	
Thin-walled and slim workpieces	
Universal wide range option	
Sharp edge	
Rounded edge	
Edge with facet	
Rounded edge with facet	
Rounded edge with double facet	

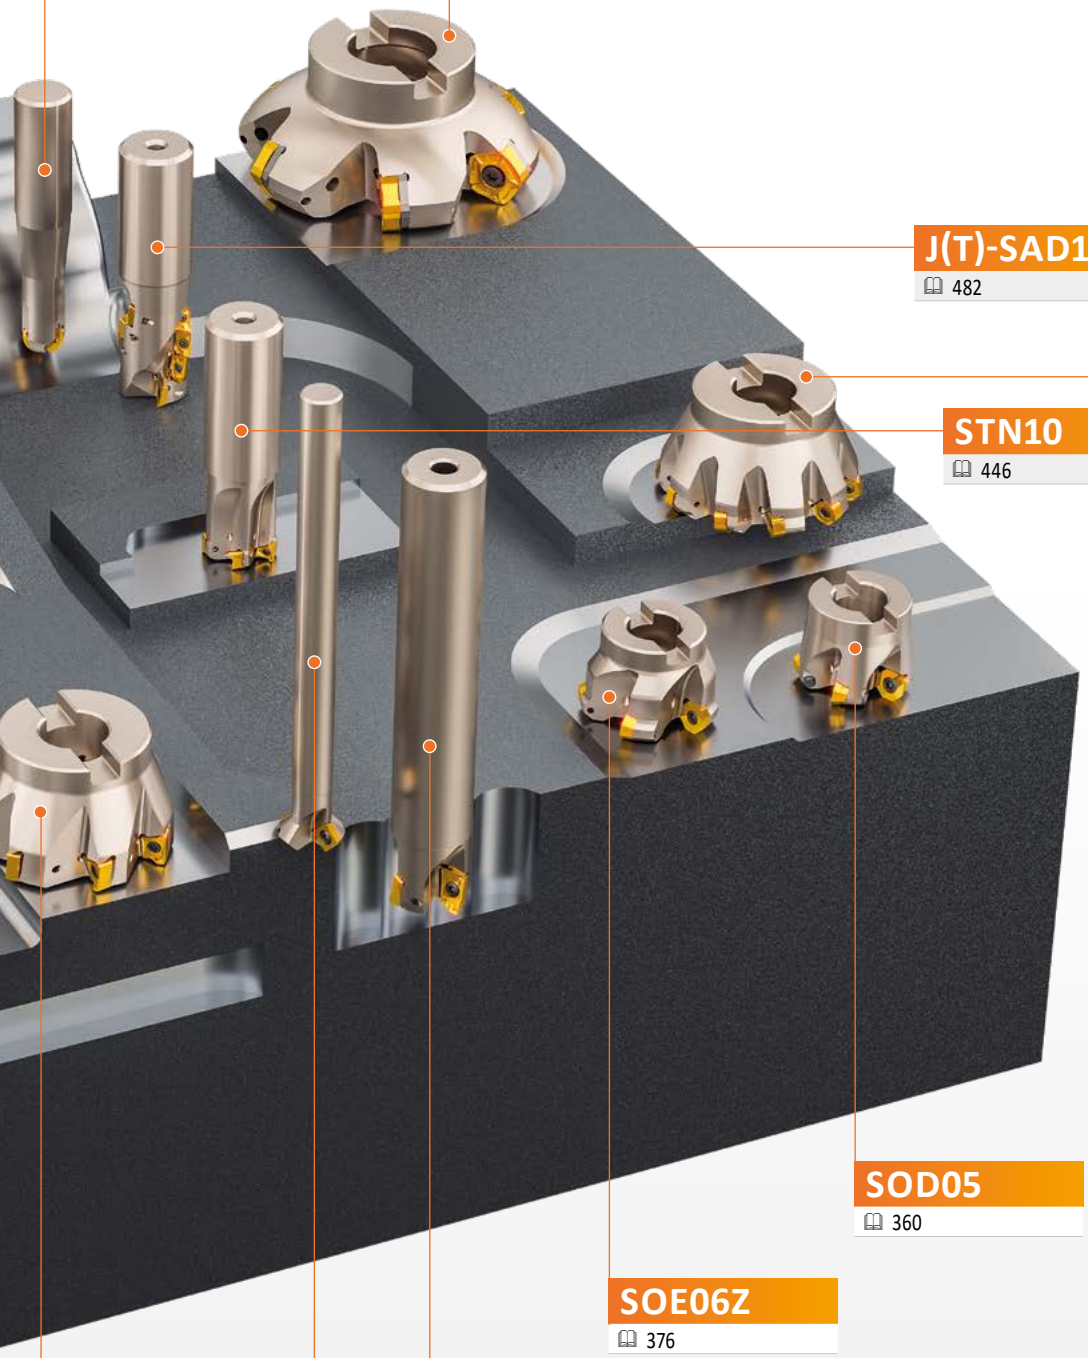

Others

Clamping torque of screw (Nm)	
Effective number of teeth	
Number of teeth (helical cutters)	

Technical Parts

Chamfering angle (°)	
Depth of cut (mm)	
Maximum cutting depth over the length of cut (mm)	
Wiper edge length (mm)	
Multiplication factor for feed (machining on centre line)	
Multiplication factor for feed (machining off centre line)	
Multiplication factor for cutting speed	
Diameter of cutter (mm)	
Maximum diameter of cutter (mm)	
Effective diameter of cutter (mm)	
Cutting depth for plunging (mm)	
Effective reach of tool (mm)	
Hole diameter (mm)	
Feed (mm/tooth)	
Minimal feed (mm/tooth)	
Maximal feed (mm/tooth)	
Chipbreaker	
Effective working length of tool (mm)	
Maximum width of machined area (mm)	
Number of edges in use	
Number of teeth	
Ratio (%) of radial width of cut to cutting diameter	
Ratio (%) of radial width of cut to maximal cutting diameter	
Corner radius of insert (mm)	
Maximal angle for ramping (°)	
Maximal depth per revolution for maximal diameter of hole (mm)	
Maximal depth per revolution for minimal diameter of hole (mm)	
Starting feed (mm/tooth)	
Contouring step in conventional milling (mm)	
Contouring step in up/down cross milling (mm)	
Roughness of machined surface R_a (µm)	
Time (min)	
Thread pitch	
Threads per inch

Grade Identification	Area of Application	Application	Feed	Cutting speed	Resistance to adverse Working Conditions	Coating	Colour	Substrate	Coolant benefit	Grade description
M9315	P05 – P25 K10 – K30 H10 – H20	■ ■ ◪				MT-CVD		H	- - -	Milling grade with high abrasion resistance even at high thermal loads, main application area is higher cutting speeds with medium or small depths of cut.
M9325	P10 – P30 K10 – K30 H15 – H20	■ ■ ◪				MT-CVD		H	- - -	This grade has an ideal balance between wear resistance and toughness, it is mainly designed for roughing operations. Advantages are excellent wear resistance even at relatively high cutting speeds with excellent reliability, this grade is more suitable for applications using higher speeds and lower feed rates.
M9340	P35 – P50 M30 – M40 S15 – S20	■ ■ ■				MT-CVD		H	- - -	A very tough grade, where the main advantage is the high strength of the cutting edge and resistance to adverse cutting conditions. Although this material has an MT-CVD M30 – M40 coating, it is possible to use emulsion cooling for its application, especially in optimum cutting conditions.
M5315	P05 – P20 K05 – K25 H05 – H20	◪ ■ ■				MT-CVD		H	- - -	One of the most abrasion-resistant milling grades which should be used under stable conditions. Its main advantage is the extremely high resistance to thermal stress and abrasive K05 – K25 wear. It is mainly used for machining hard and very hard materials, particularly cast iron.
M8310	P01 – P10 M01 – M10 K01 – K10 H05 – H15	■ ◪ ■ ◪				PVD		ultra submicron H	-	Grade specially developed for copy milling, featuring high resistance to abrasion. It is suitable for machining at higher cutting speeds under stable cutting conditions, and for machining virtually all groups of machined materials (particularly stronger and harder materials).
8215	P10 – P20 M10 – M20 K10 – K25 N10 – N25 S10 – S15 H10 – H15	■ ◪ ■ ■ ◪ ■				PVD		submicron H	+ / -	One of the most versatile milling grades, in terms of both the range of workpiece materials and the range of possible applications. It is characterised by high wear resistance and operational reliability. Its other advantages include excellent resistance to cracking induced by temperature shock. With its unique properties, this material is undoubtedly one of the pillars of the milling range.
M8325	P20 – P40 M15 – M30	■ ◪				PVD		S	-	The main application area of this grade is machining all kinds of steels (including stainless) in the "soft state". It can also be used for machining softer cast irons. Suitable for M15 – M30 machining at medium speeds under average cutting conditions.
M8330	P20 – P40 M20 – M35 K20 – K40 N15 – N30 S15 – S25 H15 – H25	■ ■ ■ ◪ ◪ ◪				PVD		submicron H	+ / -	This grade is universal and can be used for machining various types of materials. However, it's priority application area lies within steels and ductile cast irons. It is recommended for milling at medium speeds under unstable cutting conditions.
M8340	P25 – P50 M20 – M40 K20 – K40 S20 – S30	■ ■ ◪ ■				PVD		submicron H	+ / -	One of the toughest grade dedicated for machining with lower cutting speed and unfavorable conditions. This grade is ideal for all operations where the main requirement is for a tough cutting edge.

Grade Identification	Area of Application	Application	Feed	Cutting speed	Resistance to adverse Working Conditions	Coating	Colour	Substrate	Coolant benefit	Grade description
M8345	P30 – P50	■	▰▰▰▰	▰▰▱▱	▰▰▰▰+	PVD		H	-	This grade has exceptional operational reliability and is designed for heavy cuts in unfavourable conditions in difficult and tough materials.
	M30 – M40	■								
M6330	P20 – P35	■	▰▰▰▰	▰▰▱▱	▰▰▰▰	PVD		H	+/-	Milling grade with extraordinary service reliability. Especially suitable for machining of hard to machine materials. Powerful in applications where unfavourable conditions and heavy cuts dominate.
	M20 – M35	■								
	S20 – S30	■								
M4303	P01 – P10	◪	▰▰▰▱	▰▰▰▰	▰▰▱▱	PVD		ultra submicron H	-	The most wear resistant grade for mold & die applications. Offers exceptional performance at high cutting speeds and low feeds in stable cutting conditions. Suitable for finishing operations in difficult workpiece materials.
	K01 – K10	■								
	N01 – N10	◪								
	H01 – H10	■								
M4310	P05 – P15	◪	▰▰▰▰	▰▰▰▰	▰▰▰▰	PVD		ultra submicron H	-	Universal grade for mold & die applications. Suitable for finishing as well as semi-roughing operations. This grade combines high wear resistance with extraordinary operational reliability.
	M05 – M15	◪								
	K05 – K15	■								
	S05 – S10	■								
	H05 – H15	■								
2003	P01 – P10	◪	▰▰▰▰	▰▰▰▰	▰▰▰▱	PVD		ultra submicron H	-	Milling grade with excellent wear resistance. Most suitable in a machining of hard and high strength materials under stable cutting conditions and moderate/higher cutting speeds. Suitable for cutting other workpiece group materials except non-ferrous metals.
	M01 – M10	◪								
	K01 – K10	■								
	S05 – S10	■								
	H05 – H15	◪								
M0315	N05 – N25	■	▰▰▰▰	▰▰▰▱	▰▰▰▰	PVD		submicron H	-	Submicron grade for milling non-ferrous metals and their alloys with a balanced ratio of wear resistance and toughness. It is provided with a unique coating with excellent friction properties.
S26	P15 – P30	■	▰▰▰▰	▰▰▱▱	▰▰▰▰	–		S	++	Uncoated milling grade with excellent resistance to erosion of the cutting face. It is intended solely for machining carbon and alloy steels at low cutting speeds.
S45	P30 – P45	■	▰▰▰▰	▰▰▱▱	▰▰▰▰+	–		S	++	Uncoated, tough cutting grade suitable for machining applications where low cutting speed and unfavourable cutting conditions dominate.
HF7	M10 – M20	◪	▰▰▰▰	▰▰▱▱	▰▰▰▰	–		submicron H	++	Uncoated grade which is primarily designed for machining non-ferrous metals; can also be used for other machined materials (except steel). This grade can be used in turning, milling, and even boring.
	K10 – K25	■								
	N10 – N25	■								

MILLING GRADES – OVERVIEW

Substrate	
H	WC-Co based substrate
submicron H	WC-Co based substrate, fine-grained (< 1 µm)
ultra submicron H	WC-Co based substrate, very fine-grained (< 0.5 µm)
S	Substrate with cubic carbides

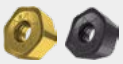

Coating	
MT-CVD	Medium-temperature chemical method of coating
PVD	Low-temperature physical method of coating
–	Uncoated grade

Coolant Benefit	
- - -	Very negative effect on tool life – cooling is not recommended
-	Slightly negative effect on tool life
+ / -	Influence of cooling may be both positive and negative – decisive factor is specific working conditions
+ +	Positive effect on tool life – cooling is recommended

Level of influence	
	Level 1 – 5

Universal planfræser med positivt design og intern kølevæske

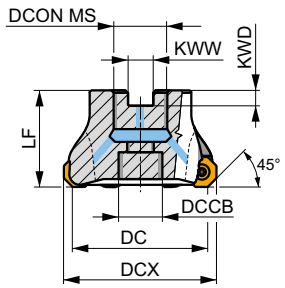

Meget produktiv universal planfræser med enkelsidede positive skær med APMX op til 10 mm. Unikt skær sæde passer til OD.. 05, RD.. 12 og SD.. 12 skær, velegnet til en lang række applikationer. Differential tanddeling. Dorn og cylindrisk type i området fra Ø 32 op til Ø 125 mm. Krop behandlet for længere værktøjslevetid.

KAPR	45°
APMX	2.7 (10.0) mm

h_m 0.03 – 0.15

Universal planfræser med positivt design og intern kølevæske

Meget produktiv universal planfræser med enkelsidede positive skær med APMX på op til 3.5 mm. Unikt skær sæde passer til OD.. 06 og RP.. 15 skær, velegnet til planfræsning og affasning. Dorn type kun i området fra Ø 63 op til Ø 160 mm med differentieret tanddeling. Krop behandlet for længere værktøjslevetid.

Universal planfræser med positivt design og intern kølevæske

Meget produktiv universal planfræser med positive enkeltsidede skær med APMX på 6 mm til RE.. 24. Unikt skær sæde passer til OE.. 09, RE.. 24 og XE.. 09 skær. Velegnet til en lang række applikationer. Dorn type kun i området fra Ø 80 op til Ø 315 mm med differentieret tanddeling. Krop behandlet for længere værktøjslevetid.

FORCE AD11 skaftfræser med indvendig kølevæske

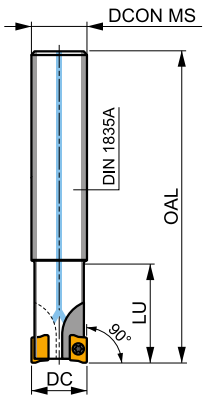

90° ende- og planfræser med positiv AD.. 11 skær med APMX på 9 mm. Velegnet til plan, hjørne, spor,spiralinterpolation , trochoidal, ramping og lommefræsning. Fås i cylindrisk, weldon, morse konisk, modulær og dorn (med differentieret tanddeling) i Ø 16 op til Ø 125 mm. Krop behandlet for længere værktøjslevetid.

S

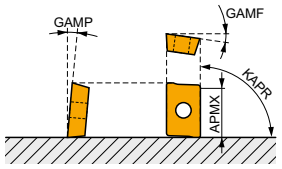

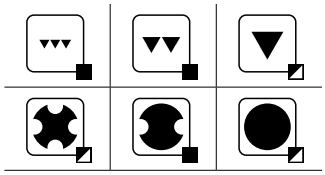

FORCE AD16 skaftfræser med indvendig kølevæske

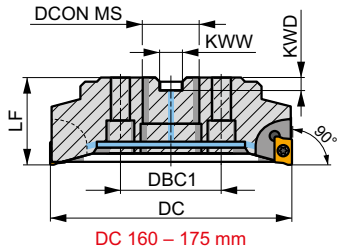

90° ende- og planfræser med positiv AD.. 16 skær med APMX på 13 mm. Velegnet til plan, hjørne, spor,spiralinterpolation , trochoidal, ramping og lommefræsning. Fås i cylindrisk, weldon, morse konisk, modulær og dorn (med differentieret tanddeling) i Ø 25 op til Ø 175 mm. Krop behandlet for længere værktøjslevetid.

ECON LN12 skaftfræser med indvendig kølevæske

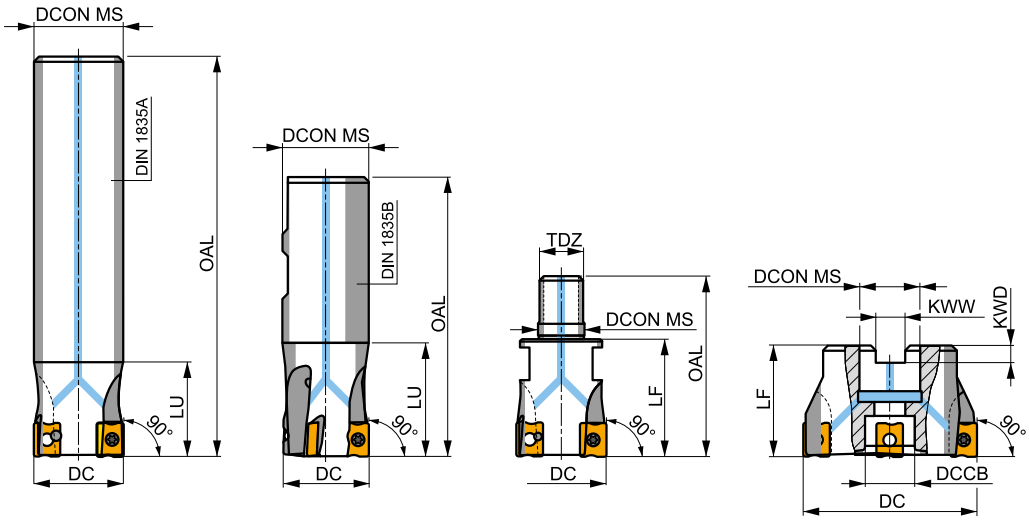

90° ende- og skaftfræser, der anvender dobbeltsidet LN.. 12 skær med APMX på 9 mm. Velegnet til en lang række applikationer. Fås i cylindrisk, svejset, modulær og dorn (med differentieret tandhøjde) i Ø 25 op til Ø 125 mm. Krop behandlet for længere levetid på værktøjet.

KAPR	90°
APMX	9.0 mm

HELISK AD11 Langfræser med intern kølevæske

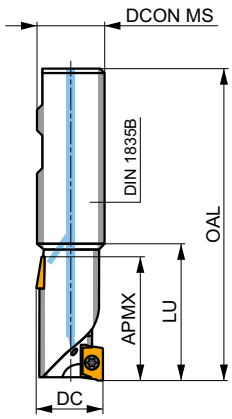

90° langskærsfræse med positiv ADMX 11 skær med APMX på 36 op til 56 mm med indvendigt kølevæske. Velegnet til hjørner-, spor-, plan- eller lommefræsning. Fås i weldon, MK eller dorn, i Ø 25 op til Ø 50 mm. Krop behandlet for længere værktøjslevetid.

Langfræsning til mellemfræsning til AP.. 15 og SP.. 12 skær

90° endefræser med positiv AD.. 15 skær med APMX på 12 mm. Velegnet til applikationer, herunder plan, hjørne, spor,spiralinterpolation, trochoidal, ramping og lommefræsning. Fås i DIN69871 og DIN 2080 og med differentieret tandafstand i Ø 50 op til Ø 80 mm. Krop behandlet for længere værktøjslevetid.

KAPR	90°
APMX	58.0 – 95.0 mm

Side- og planfræser med justerbar bredde

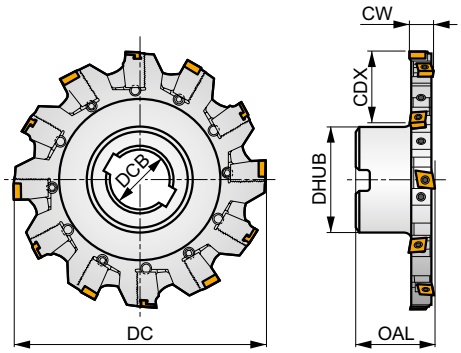

90° side- og planfræser med CNHQ 10 og XNHQ 12, 16 skær med APMX (spordybde) på 25 op til 110 mm. Velegnet til hjørne-, spor-, bagside- og planfræsning. Fås med dorn eller kort dorn, i området Ø 125 op til Ø 315 mm. Krop behandlet for længere værktøjslevetid.

KAPR	90°

Kopi Fræser til runde skær RCMT 10 med intern kølevæske

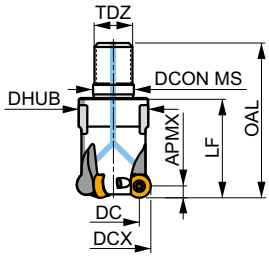

Fræser til kopfræsning ved hjælp af positive RCMT 10 skær med APMX på 5 mm. Intern kølevæske. Velegnet til plan, spiralformet interpolation, ramping, progressiv lomme og højfræsning. Fås i cylindrisk, modulær og dorn-stil i området Ø 25 op til Ø 66 mm. Krop behandlet for længere værktøjslevetid.

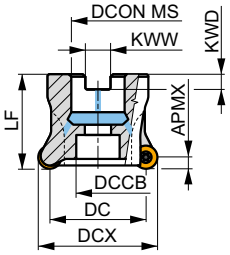

APMX	5.0 mm

Kopi Fræser til runde skær RD 12 med intern kølevæske

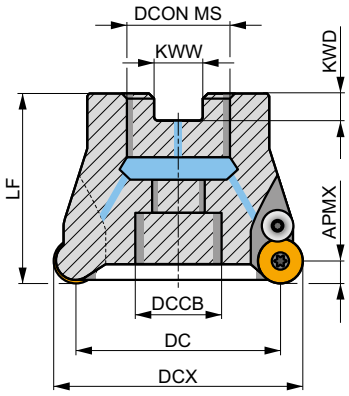

Fræser til kopfræsning ved hjælp af positive RD.. 12 skær med APMX på 3 mm. Intern kølevæske. Velegnet til plan, spiralformet interpolation, ramping, progressiv lomme og kopifræsning. Fås i weldon og modulær type i området Ø 24 op til Ø 80 mm. Krop behandlet for længere værktøjslevetid.

APMX	3.0 mm

Kopi og profil Endefræser til efterbehandling

Endefræser til efterbehandling i en lang række applikationer ved hjælp af LC-skær. Højpræcisions skærholder giver fremragende nøjagtighed. Til profilering, affasning, spiralinterpolation, progressiv sporfræsning og rampning. Fås kun i cylindrisk type i området Ø 12 op til Ø 20 mm. Krop behandlet for længere levetid på værktøjet.

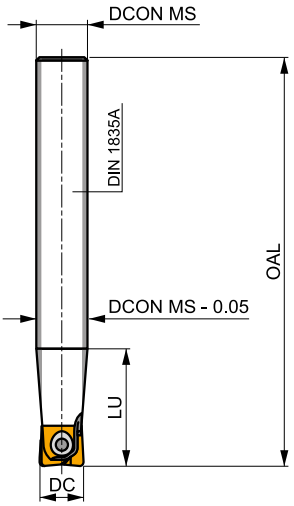

APMX	1.0 – 3.0 mm

DC 12 - 16 mm

DC 20 mm

Kopi og profil Ende fræser

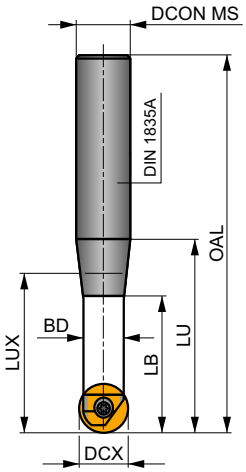

Fleksibel endefræser til en bred vifte af værktøjsfremstilling applikationer. Én værktøjsløsning til kugle-, toroid- og high feed skær. Højpræcisions grundskær giver høj nøjagtighed. Fås i cylindrisk og modulær stil i området Ø 8 op til Ø 32 mm. Krop behandlet for længere værktøjslevetid.

Fræser til bearbejdning af ikke-jernholdige materialer med intern kølevæske

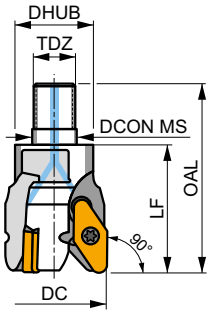

Meget produktiv fræser til aluminium og ikke-jernholdigt materiale ved hjælp af VCGT 22 skær med APMX på 16 mm. Intern kølevæske. Velegnet til plan, progressivt spring, hjørne, ramping og sporfræsning. Fås i cylindrisk, modulær og dorn-type i området Ø 32 op til Ø 80 mm. Krop behandlet for længere værktøjslevetid.

Endefræser til applikationer til matricer og støbeforme med intern kølevæske

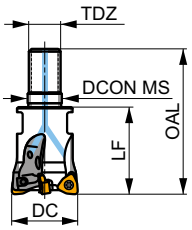

Endefræser til en lang række applikationer i efterbehandlingsområdet til værktøjsfremstilling med APMX på 0.5 mm. Højpræcisions WNHX 04-skær med 6 skærekanter giver høj nøjagtighed og økonomi. Fås i cylindrisk og modulær stil i området Ø 20 op til Ø 35 mm. Krop behandlet for længere værktøjslevetid.

High Feed fræser til BN.. 10 skær med intern kølevæske, næste generation

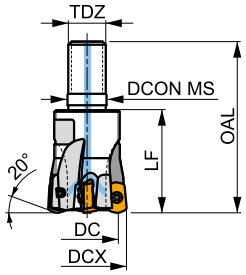

High feed fræser til mindre diametre ved hjælp af dobbeltsidede BNGX 10 skær med fire skærekanter og APMX på 1 mm. Intern kølevæske. Velegnet til en lang række applikationer. Fås i cylindrisk, modulær og dorn-type i området Ø 16 op til Ø 42 mm. Krop behandlet for længere værktøjslevetid.

High Feed fræser til SN.. 11 skær med intern kølevæske, næste generation

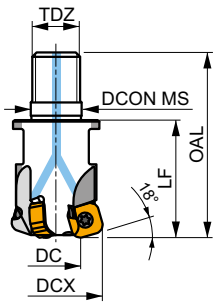

High feed fræser til større diametre ved hjælp af dobbeltsidede SNXG 11 skær med otte skærekanter og APMX på 1.7 mm. Intern kølevæske. Velegnet til en lang række applikationer. Fås i cylindrisk, modulær og dorn-type i området Ø 32 op til Ø 125 mm. Krop behandlet for længere værktøjslevetid.

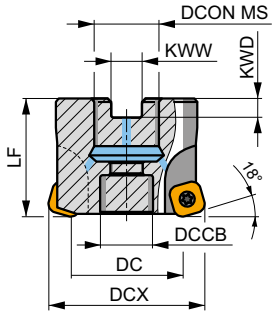

KAPR	18°
APMX	1.7 mm

PENTA HF fræser high feed med intern kølevæske

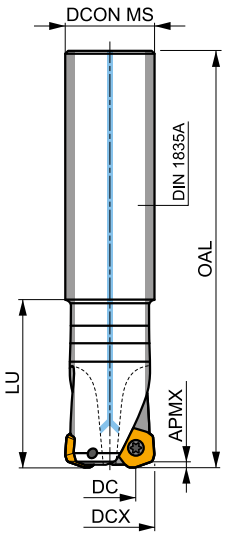

Produktiv high feed fræser til fræsning med enkeltsidet positiv PD.. 09-skær med 5 skærekanter og APMX på 2 mm. Intern kølevæske. Velegnet til en lang række applikationer. Fås i cylindrisk og dorn type i området Ø 32 op til Ø 140 mm. Krop behandlet for længere værktøjslevetid.

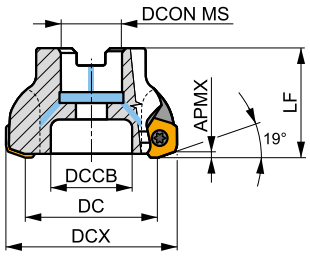

KAPR	19°
APMX	2.0 mm

PENTA HF

APMX	1.6 mm

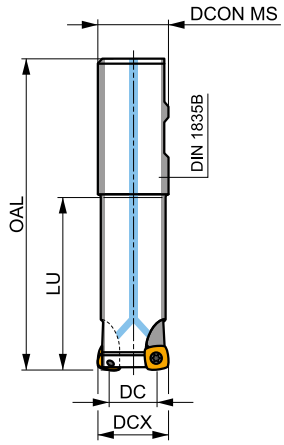

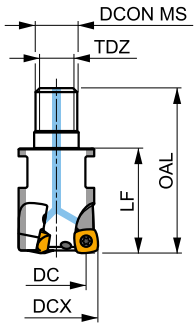

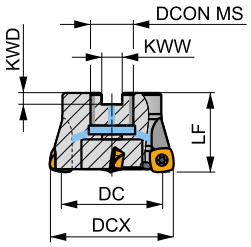

FEED ZD12 Fræser til high feed med intern kølevæske

Meget produktiv high feed fræser med enkeltsidet ZD.. 12 skær med 4 skærekanter og APMX på 1.6 mm. Intern kølevæske. Velegnet til en lang række applikationer. Fås i cylindrisk, modulær og dorn-type i området Ø 32 op til Ø 80 mm. Krop behandlet for længere værktøjslevetid.

INDEKSFRÆSERE – TEKNISK INFORMATION

WORKPIECE MATERIAL GROUP (WMG)

ABOUT DORMER PRAMET'S WORKPIECE MATERIAL CLASSIFICATION

Workpiece **M**aterial **G**roups (**WMG**) are used to support easy and reliable selection of the right cutting tool and starting values for machining conditions in particular applications.
Dormer Pramet classifies workpiece materials into six different coloured groups;

- **Blue**: Steel and cast steel (P-group)
- **Yellow**: Stainless steel (M-group)
- **Red**: Cast iron (K-group)
- **Green**: Non-ferrous metals (N-group)
- **Brown**: High-temperature alloys (S-group)
- **Grey**: Hardened materials (H-group)

Each of these are divided into subgroups on the basis of their structure and/or composition. For example, P-group steel and cast steel is split into four subgroups, namely;

- **P1** – Free machining steel
- **P2** – Plain carbon steel
- **P3** – Alloy steel
- **P4** – Tool steel

A final division includes material properties, such as hardness and ultimate tensile strength. This is to provide our customers with a complete tool recommendation, including starting values for cutting speed and feed.
The table on the next page includes a description of each workpiece material group, as well as examples of commonly used designations.

ISO group		Subgroup		WMG (Work Material Group)		k_{VG}	Examples of material (AISI, EN, DIN, ČSN, GB, SS, STN, BS, UNE, AFNOR, ASTM, GOST, UNS, UNI, ...)
P	**Steel and cast steel** (steels with alloy content ≤ 10 % and a hardness of < 45HRC)	P1	Free machining steel (carbon steels with increased machinability)	P1.1	Free machining sulfurized carbon steel with a hardness of < 240 HB	1.33	AISI **1108,** EN **15S22,** DIN **1.0723,** SS **1922,** ČSN **11120,** BS **210A15,** UNE **F.210F,** GB **Y15,** AFNOR **10F1,** GOST **A30,** UNI **CF10S20**
				P1.2	Free machining sulfurized and phosphorized carbon steel with a hardness of < 180 HB	1.49	AISI **1211,** EN **11SMn30,** DIN **1.0715,** SS **1912,** ČSN **11109,** BS **230M7,** UNE **F.2111,** GB **Y15,** AFNOR **S250,** GOST **A40G,** UNI **CF9SMn28**
				P1.3	Free machining sulfurized/phosphorized and leaded carbon steel with a hardness of < 180 HB	1.53	AISI **12L13,** EN **11SMnPb30,** DIN **1.0718,** SS **1914,** ČSN **12110,** BS **210M16,** UNE **F.2114,** GB **Y15Pb,** AFNOR **S250Pb,** GOST **AS35G2,** UNI **CF10SPb20**
		P2	Plain carbon steel (steels comprised of mainly iron and carbon)	P2.1	Plain low carbon steel containing < 0.25 % C with a hardness of < 180 HB	1.14	AISI **1015,** EN **C15,** DIN **1.0401,** SS **1350,** ČSN **11301 ,** BS **080A15,** UNE **F.111,** GB **15,** AFNOR **C18RR,** GOST **St2ps,** UNI **Fe360**
				P2.2	Plain medium carbon steel containing < 0.55 %C with a hardness of < 240 HB	1.00	AISI **1030,** EN **C30,** DIN **1.0528,** SS **1550,** ČSN **12031,** BS **080M32,** UNE **F.1130,** GB **30,** AFNOR **AF50C30,** GOST **30G,** UNI **Fe590**
				P2.3	Plain high carbon steel containing > 0.55 % C, with a hardness of < 300 HB	0.89	AISI **1060,** EN **C60,** DIN **1.0601,** SS **1655,** ČSN **12061,** BS **080A62,** UNE **F513,** GB **60,** AFNOR **1C60,** GOST **60G,** UNI **C60**
		P3	Alloy steel (carbon steels with an alloying content ≤ 10 %)	P3.1	Alloy steel with a hardness of < 180 HB	0.92	AISI **5015,** EN **16Mo3,** DIN **1.5415,** SS **2912,** ČSN **15020,** BS **1501-240,** UNE **F.2601,** GB **16Mo,** AFNOR **15D3,** GOST **15M,** UNI **16Mo3KW**
				P3.2	Alloy steel with a hardness of 180 – 260 HB	0.74	AISI **4140,** EN **42CrMo4,** DIN **1.7225,** SS **2244,** ČSN **15142,** BS **708M40,** UNE **F.8232,** GB **42CrMo,** AFNOR **42CD4,** GOST **40ChFA,** UNI **42CrMo4**

Parts of an Indexable Insert

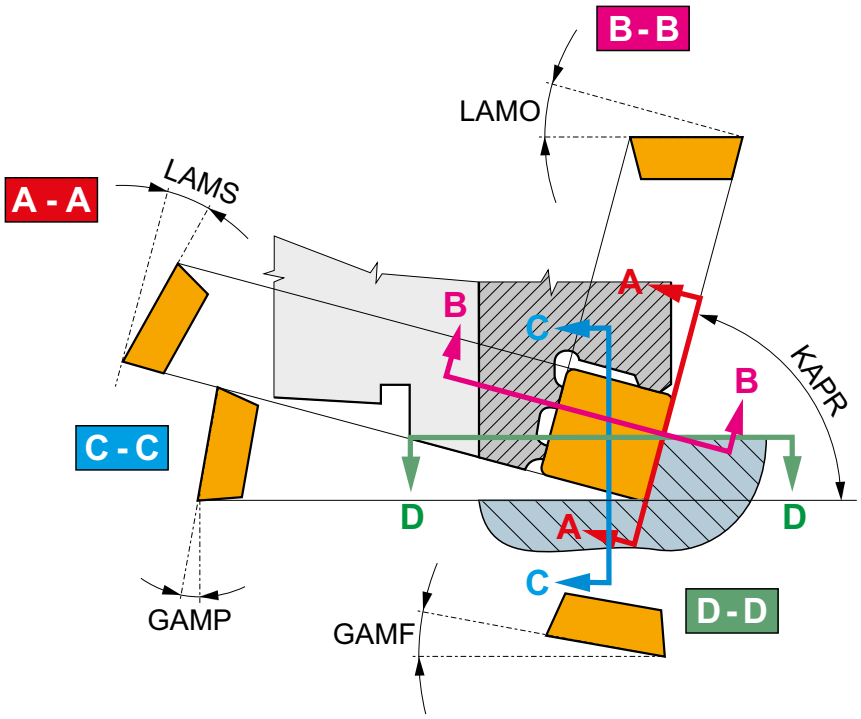

Geometry of milling tool

Constructional angles determine the basic orientation of the seat position that the cutting insert is clamped in and are therefore important for the design of the milling cutter body. There are two angles: axial face angle *GAMP* – γ_p (tool back rake) and radial face angle *GAMF* – γ_f (tool side rake) – see picture below.
Working angles are the setting angle *KAPR* – κ_r, the orthogonal face angle *GAMO* γ_o and the rake angle of the cutting edge *LAMS* – λ_s.

- **Orthogonal face angle** *GAMO* – γ_o affects not only the extent of plastic deformation of the cut chip but also the cutting force and temperature. The bigger the rake angle *GAMO* – γ_o, the lower the cutting force and power demand of the spindle motor (and vice versa).
- **Setting angle** *KAPR* – κ_r determines the thickness of the chip at a specific feed per tooth f_z and axial depth of cut a_p. It therefore affects cutting forces, specifically load, wear and tool service life. Reducing the setting angle *KAPR* – κ_r at a constant feed f_z causes a decrease in the chip thickness h.
- **Rake angle of cutting edge** *LAMS* – λ_s together with setting angle *KAPR* – κ_r and face angle *GAMO* – γ_o, this determines the point of first contact between the edge and work piece. That is why it affects the resistance of the edge to chipping during interrupted cut. At the same time, it affects the direction of chip evacuation.

Working angles of the tool you can determine the bed using the formulas or diagrams below.

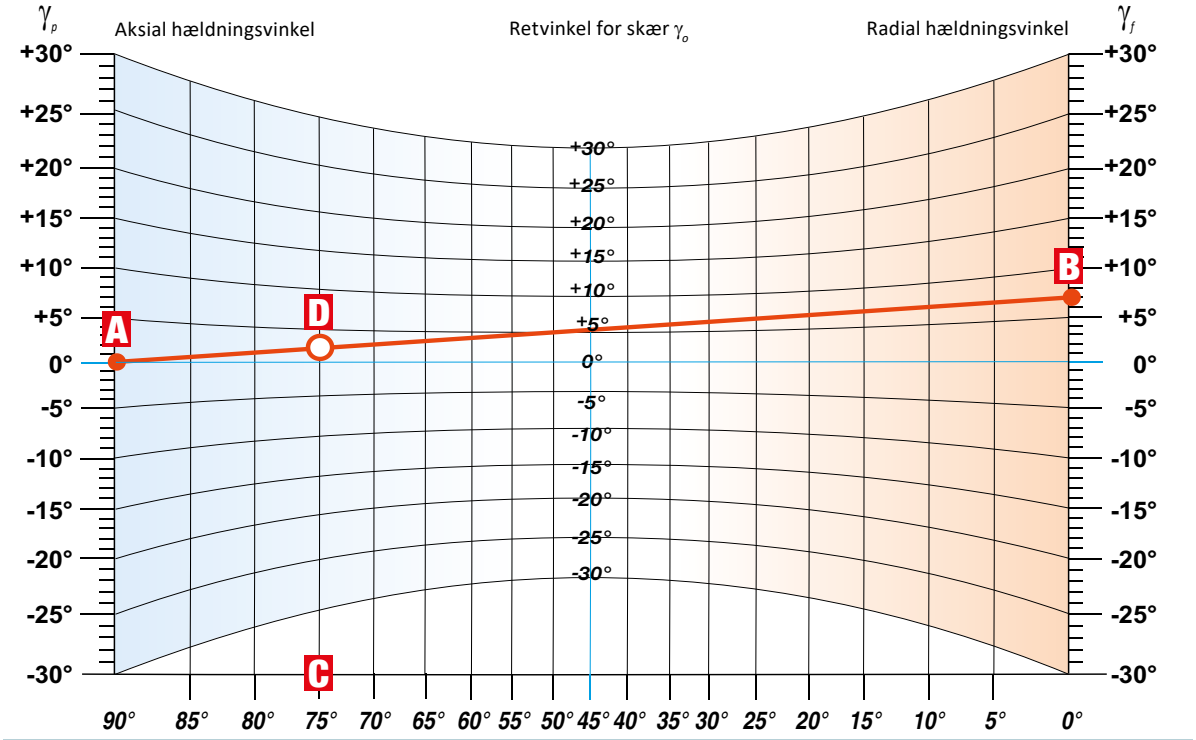

Working and constructional angles of milling tool

NOMOGRAM FOR CALCULATING THE WORKING GEOMETRY OF MILLING TOOL

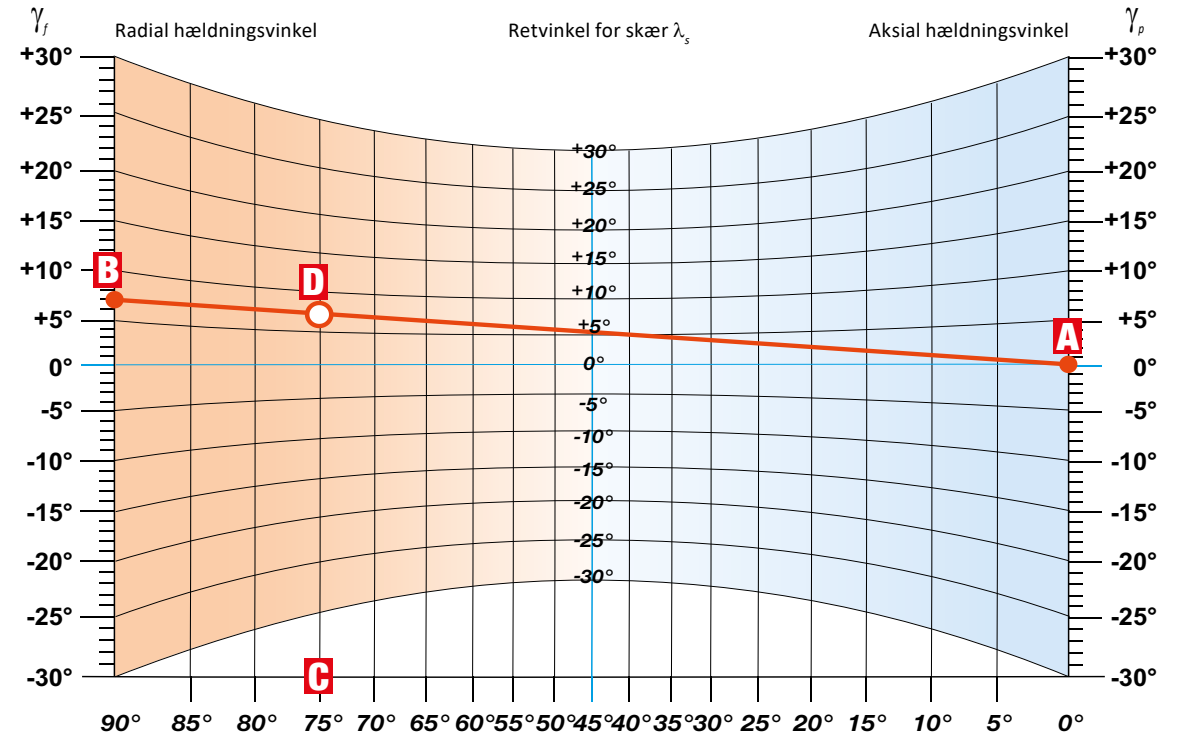

Nomogram for calculating the working geometry of mills

$$\tan \gamma_o = \tan \gamma_p \times \sin \kappa_r + \tan \gamma_f \times \cos \kappa_r$$

Indstillingsvinkel for skær *KAPR* (κ_r)

$$\tan \lambda_s = \tan \gamma_f \times \sin \kappa_r - \tan \gamma_p \times \cos \kappa_r$$

Indstillingsvinkel for skær *KAPR* (κ_r)

NOMOGRAM FOR CALCULATING THE WORKING GEOMETRY OF MILLING TOOL

The exiting of the cutting edge from the cut is also accompanied by thermal stress, caused by a rapid reduction in temperature of the surface layer of the cutting edge and mechanical stress caused by elastic deformation relief of the surface layer of workpiece at a rapid drop in cutting force.

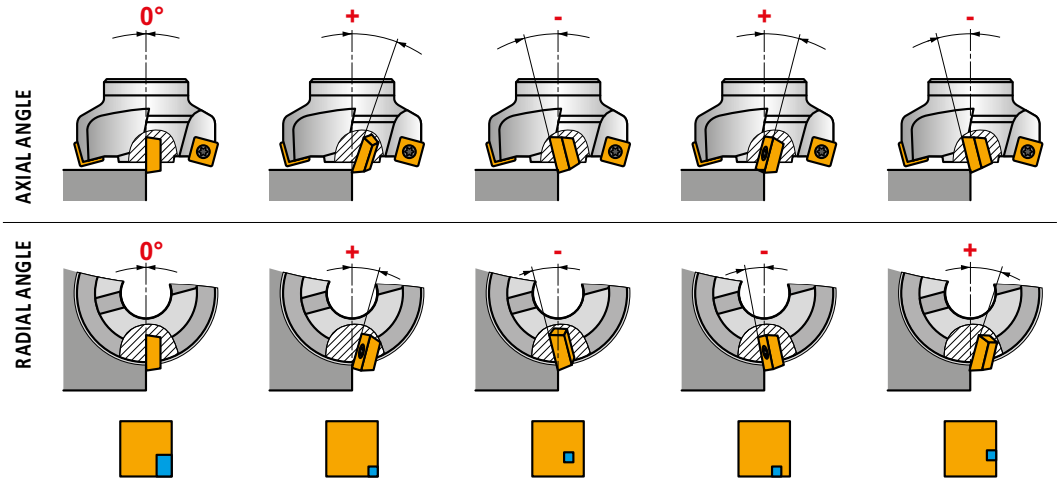

That is why we use the average value of chip thickness h_m for any calculations.

The chip thickness h fluctuates during one revolution depending on angle φ in accordance with the formula $h\varphi = f_z \times sin\varphi$.

The maximum chip thickness equal to f_z is reached at the axis of the milling cutter. The average chip thickness h_m cut by one tooth during one revolution is equal to the height of the rectangle of the same area as the area under the sine curve relates to the radial depth of cut a_e.

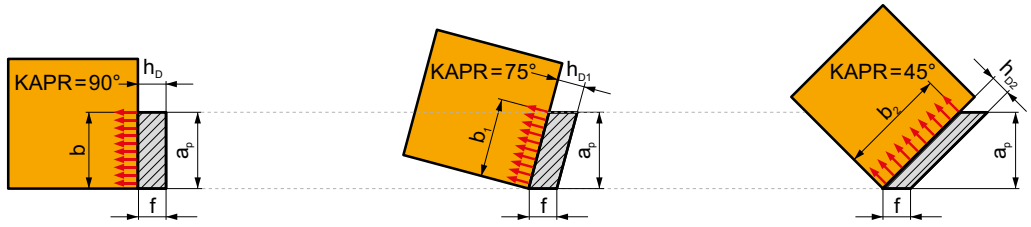

The average chip thickness h_m depends on the type of milling cutter and the cutting conditions, especially on the relation a_e / DC, feed per tooth f_z and the setting angle $KAPR - \kappa_r$. See picture on the next page for an illustrative example.

Milling Cutter Geometry

When choosing a tool, it is necessary to take many criteria into account. One of the primary requirements is that the place of first contact between the cutting wedge and the workpiece lie further away from the tip and the cutting edge. That, however, is dependent on the basic geometry of the cutting wedge i.e. angles *GAMO* – γ_o, *LAMS* – λ_s, *KAPR* – κ_r , as well as the mutual position of the milling cutter and the entry edge of the workpiece. The following figure shows individual milling cutter geometries (or rather, the combinations of radial and axial angles) at some of the most adverse engagement conditions (i.e. when the axis of the milling cutter is in line with the edge of the workpiece). At the bottom of the figure is a depiction of the indexable insert with an indication of the area where the insert makes first contact with the workpiece. The figure shows that in such adverse engagement conditions, tools with negative – negative geometry perform the best, while tools with positive – positive geometry will be the most problematic. Another criterion is chip removal. Negative – negative tools push the chip into the work surface (towards the workpiece) while positive – positive tools do the opposite, leading the chip away from the work surface, i.e. away from the workpiece. It is thus an optimal compromise to combine negative and positive angles.

Entering Angle

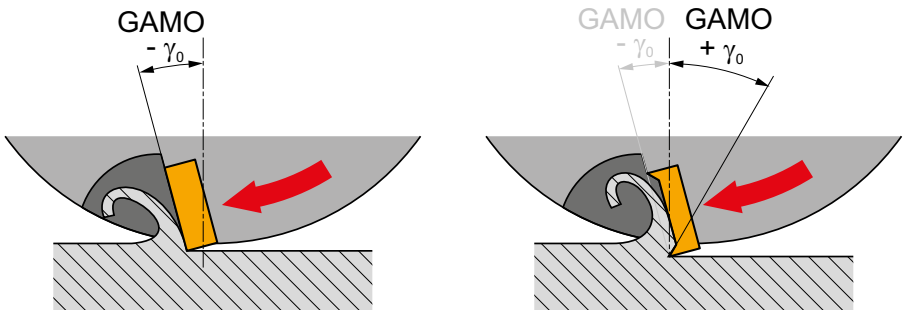

KAPR = 90°	KAPR = 75°	KAPR = 45°
$h_D = f$	$h_{D1} = 0{,}97f$	$h_{D2} = 0{,}71f$
$k_c = 1{,}00\ k_{c1}$	$k_c = 1{,}01\ k_{c1}$	$k_c = 1{,}09\ k_{c1}$
$k_c/b = 1{,}00$	$k_c/b_1 = 0{,}98$	$k_c/b_2 = 0{,}77$

When choosing the entering angle for face milling, you should, among other things, account for the power and rigidity of the machine (size and type of tool holder), its dynamic capabilities and maximum depth of removal. For instance, if you have a high-performance (50 – 100 kW) machine at your disposal with an ISO 50 tool holder and you cut at high depth, your first choice should be a milling cutter with an entering angle between 90° – 58°. On the other hand, if you have a low-power machine (up to 10 kW) with an ISO 40 (HSK 63) tool holder and you expect to cut at 2 – 3 mm depth, you should choose a tool with an entering angle of 45° – 10° (i.e. HFC) or with round inserts. It would thus be an ideal compromise to choose a tool with an entering angle of 45°, which can also handle higher depths of cut and, when compared to a tool with an entering angle of 90°, can cut at the same depth at up to 30 % higher feed and at approximately the same load. Finally, it is important to emphasise that the lower the entering angle, the thinner the chip and the longer the engaged section of the cutting wedge, which is important with regard to heat dissipation and the distribution of force across the edge of the insert. Also worth mentioning is the change in the direction of the resultant cutting forces, which, in simplified terms, can be visualised as perpendicular to the edge. (Decreasing the entering angle increases the passive component of the cutting force leading into the spindle and decreases the active radial component of the cutting force).

The following figure shows the assortment of Pramet milling cutters with regard to the entering angle and the basic geometry of the cutter body (i.e. the axial and radial angle of the face). However, it must be pointed out that insert geometry may change the resulting geometry of the tool as indicated in the following figure.

Number of Teeth on the Milling Cutter

The number of teeth on the milling cutter is also important in relation to the width of the milled surface, where it determines the force (and acoustic) characteristics of the cut, as indicated in the following figure.

			
Feed per minute	+	++	+++
Tough materials	+++	++	+
Power requirement	+	++	+++
Resulting roughness	+++	++	+
			

Tooth Pitch

0 or 1 edge in contact

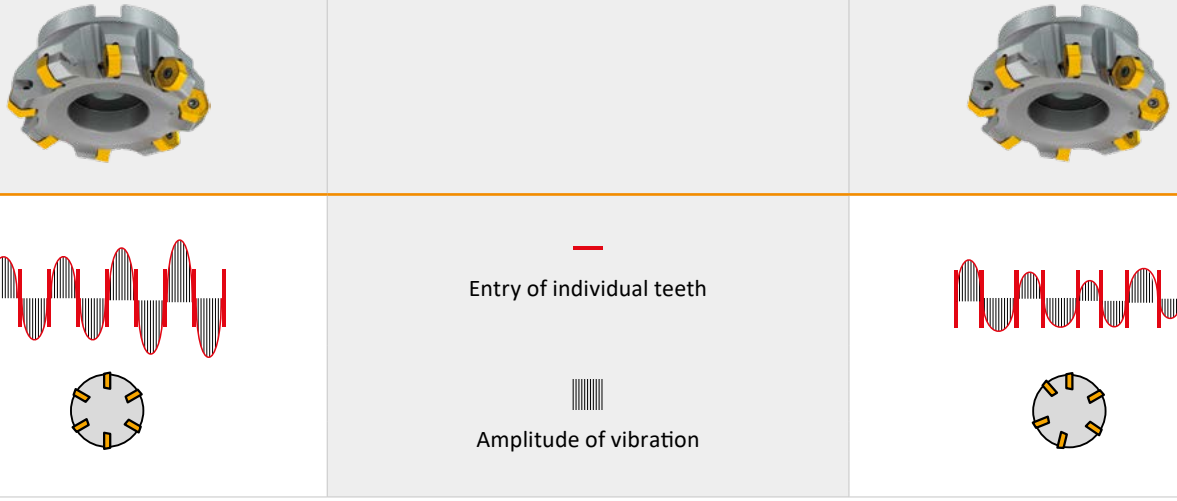

Only 1 edge in contact the whole time

1 or 2 edges in contact

2 edges in contact the whole time

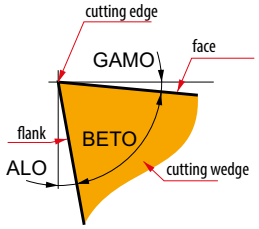

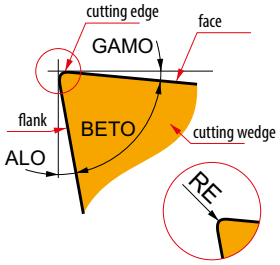

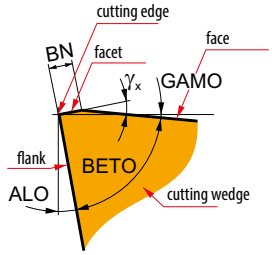

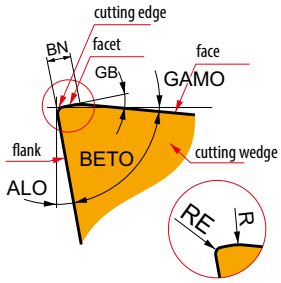

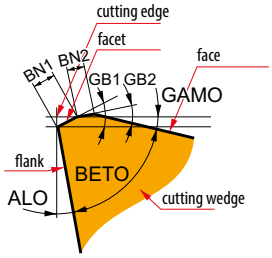

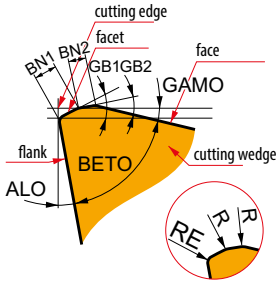

2 or 3 edges in contact

In addition, some tool families offer the option to choose between even and uneven tooth pitch. Using a tool with an uneven tooth pitch interferes with harmonic oscillation and, as a result, helps improve stability and reduce the risk of vibration. That means you should choose uneven tooth pitch if you anticipate a risk of vibration, i.e. primarily when working at higher overhang or when machining at high radial depth of cut and under conditions which are not entirely stable.

When choosing an indexable insert, please also pay attention to its microgeometry, which is indicated by icons directly in the catalogue section. Below is an overview of the types of cutting edges you can find on our inserts.

Overview of Cutting Edge Designs

F		**Sharp cutting edges** – recommended for inserts designed for use with milling cutters for Al alloys. Sharp cutting wedges result in minimal deformation of the cut layer, reduced build-up on the edge and a lower cutting force requirement. However, the strength of the cutting wedge is lower compared to other types.
E		**Rounded cutting edges** – a slight rounding of the wedge with the aim of eliminating micro-imperfections on its surface. Rectifying the wedge at a certain very low radius (*RE*) improves the cutting edge's resistance to mechanical damage, i.e. brittle fracture or so-called micro-crumbling. This modification is currently used on all indexable inserts without a facet (F modification previously), which are used for milling almost all types of material.
T		**Faceted cutting edges** – a facet with width of x and angle of γ_x increases the angle γ_n of the cutting wedge in the immediate vicinity of the cutting edge, thus also increasing its strength, i.e. its resistance to mechanical load, brittle damage or fracture. Currently used only rarely, as it has been replaced by the S modification.
S		**Rounded edges with facet** – compared to the T modification, the insert has undergone rectification which results in rounding of the cutting edge and thickening by a facet. This modification increases the resistance of the wedge against mechanical damage to a greater degree.
K		**Edges with double facet** – double facet with widths of x_1 x_2 and angle of γ_{x1} γ_{x2} further increases the strength of the edge, i.e. its resistance to mechanical stress, brittle damage or fracture. Rarely used for milling inserts, only for the most difficult cuts.
P		**Rounded edges with double facet** – compared to the K modification, the insert has undergone rectification which results in rounding of the cutting edge and thickening by a double facet. This modification provides the wedge with maximum resistance to mechanical damage.

707

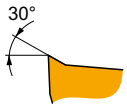

Geometry of milling inserts

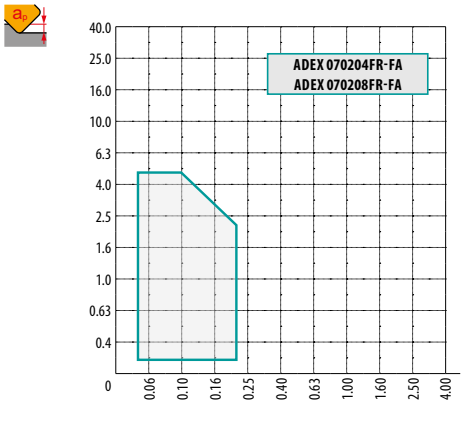

The following tables should allow you to choose the insert geometry more precisely with respect to the groups of materials being machined, the nature of the cut, the considered range of depths of cut and the feeds. Cuttings with the main cutting edge are also available (remember that you must also consider the geometry of the cutters when assessing the final geometry).

Grade Identification	Area of Application	Application	Feed	Cutting speed	Resistance to adverse Working Conditions	Coating	Colour	Substrate	Coolant benefit	Grade description
M9315	P05 – P25 K10 – K30 H10 – H20	■ ■ ◪				MT-CVD		H	- - -	Milling grade with high abrasion resistance even at high thermal loads, main application area is higher cutting speeds with medium or small depths of cut.
M9325	P10 – P30 K10 – K30 H15 – H20	■ ■ ◪				MT-CVD		H	- - -	This grade has an ideal balance between wear resistance and toughness, it is mainly designed for roughing operations. Advantages are excellent wear resistance even at relatively high cutting speeds with excellent reliability, this grade is more suitable for applications using higher speeds and lower feed rates.
M9340	P35 – P50 M30 – M40 S15 – S20	■ ■ ■				MT-CVD		H	- - -	A very tough grade, where the main advantage is the high strength of the cutting edge and resistance to adverse cutting conditions. Although this material has an MT-CVD M30 – M40 coating, it is possible to use emulsion cooling for its application, especially in optimum cutting conditions.
M5315	P05 – P20 K05 – K25 H05 – H20	◪ ■ ■				MT-CVD		H	- - -	One of the most abrasion-resistant milling grades which should be used under stable conditions. Its main advantage is the extremely high resistance to thermal stress and abrasive K05 – K25 wear. It is mainly used for machining hard and very hard materials, particularly cast iron.
M8310	P01 – P10 M01 – M10 K01 – K10 H05 – H15	■ ◪ ■ ◪				PVD		ultra submicron H	-	Grade specially developed for copy milling, featuring high resistance to abrasion. It is suitable for machining at higher cutting speeds under stable cutting conditions, and for machining virtually all groups of machined materials (particularly stronger and harder materials).
8215	P10 – P20 M10 – M20 K10 – K25 N10 – N25 S10 – S15 H10 – H15	■ ◪ ■ ■ ◪ ■				PVD		submicron H	+ / -	One of the most versatile milling grades, in terms of both the range of workpiece materials and the range of possible applications. It is characterised by high wear resistance and operational reliability. Its other advantages include excellent resistance to cracking induced by temperature shock. With its unique properties, this material is undoubtedly one of the pillars of the milling range.
M8325	P20 – P40 M15 – M30	■ ◪				PVD		S	-	The main application area of this grade is machining all kinds of steels (including stainless) in the "soft state". It can also be used for machining softer cast irons. Suitable for M15 – M30 machining at medium speeds under average cutting conditions.
M8330	P20 – P40 M20 – M35 K20 – K40 N15 – N30 S15 – S25 H15 – H25	■ ■ ■ ◪ ◪ ◪				PVD		submicron H	+ / -	This grade is universal and can be used for machining various types of materials. However, it's priority application area lies within steels and ductile cast irons. It is recommended for milling at medium speeds under unstable cutting conditions.
M8340	P25 – P50 M20 – M40 K20 – K40 S20 – S30	■ ■ ◪ ■				PVD		submicron H	+ / -	One of the toughest grade dedicated for machining with lower cutting speed and unfavorable conditions. This grade is ideal for all operations where the main requirement is for a tough cutting edge.

Grade Identification	Area of Application	Application	Feed	Cutting speed	Resistance to adverse Working Conditions	Coating	Colour	Substrate	Coolant benefit	Grade description
M8345	P30 – P50	■				PVD		H	-	This grade has exceptional operational reliability and is designed for heavy cuts in unfavourable conditions in difficult and tough materials.
	M30 – M40	■								
M6330	P20 – P35	■				PVD		H	+ / -	Milling grade with extraordinary service reliability. Especially suitable for machining of hard to machine materials. Powerful in applications where unfavourable conditions and heavy cuts dominate.
	M20 – M35	■								
	S20 – S30	■								
M4303	P01 – P10	◪				PVD		ultra submicron H	-	The most wear resistant grade for mold & die applications. Offers exceptional performance at high cutting speeds and low feeds in stable cutting conditions. Suitable for finishing operations in difficult workpiece materials.
	K01 – K10	■								
	N01 – N10	◪								
	H01 – H10	■								
M4310	P05 – P15	◪				PVD		ultra submicron H	-	Universal grade for mold & die applications. Suitable for finishing as well as semi-roughing operations. This grade combines high wear resistance with extraordinary operational reliability.
	M05 – M15	◪								
	K05 – K15	■								
	S05 – S10	■								
	H05 – H15	■								
2003	P01 – P10	◪				PVD		ultra submicron H	-	Milling grade with excellent wear resistance. Most suitable in a machining of hard and high strength materials under stable cutting conditions and moderate/higher cutting speeds. Suitable for cutting other workpiece group materials except non-ferrous metals.
	M01 – M10	◪								
	K01 – K10	■								
	S05 – S10	■								
	H05 – H15	◪								
M0315	N05 – N25	■				PVD		submicron H	-	Submicron grade for milling non-ferrous metals and their alloys with a balanced ratio of wear resistance and toughness. It is provided with a unique coating with excellent friction properties.
M8326	P20 – P40	■				PVD		H	-	Special grade for heavy duty. The main application area of this grade is machining all kinds of steels (including stainless) in the „soft state". It can also be used for machining softer cast irons. Suitable for M15 – M30 machining at medium speeds under average cutting conditions.
	M15 – M30	◪								
M8346	P30 – P50	■				PVD		H	-	Special grade for heavy duty. This grade has exceptional operational reliability and is designed for heavy cuts in unfavourable conditions in difficult and tough materials.
	M30 – M40	■								
S26	P15 – P30	■				–		S	++	Uncoated milling grade with excellent resistance to erosion of the cutting face. It is intended solely for machining carbon and alloy steels at low cutting speeds.
S45	P30 – P45	■				–		S	++	Uncoated, tough cutting grade suitable for machining applications where low cutting speed and unfavourable cutting conditions dominate
HF7	M10 – M20	◪				–		submicron H	++	Uncoated grade which is primarily designed for machining non-ferrous metals; can also be used for other machined materials (except steel). This grade can be used in turning, milling, and even boring.
	K10 – K25	■								
	N10 – N25	■								

MILLING GRADES – OVERVIEW

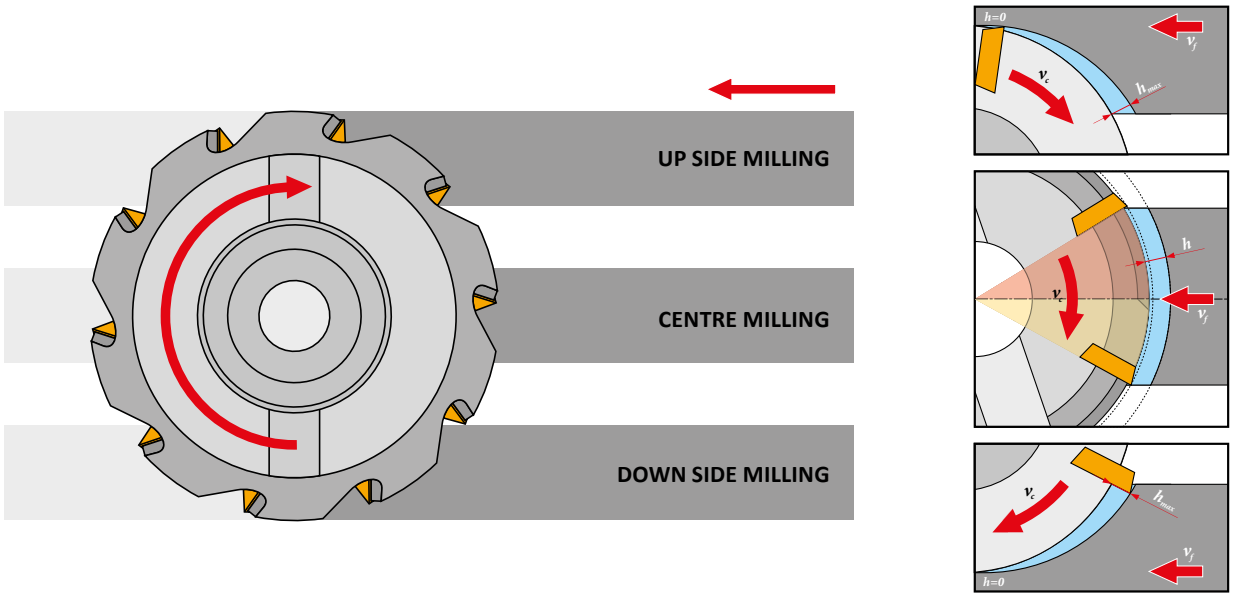

Substrate	
H	WC-Co based substrate
submicron H	WC-Co based substrate, fine-grained (< 1 µm)
ultra submicron H	WC-Co based substrate, very fine-grained (< 0.5 µm)
S	Substrate with cubic carbides

Coating	
MT-CVD	Medium-temperature chemical method of coating
PVD	Low-temperature physical method of coating
–	Uncoated grade

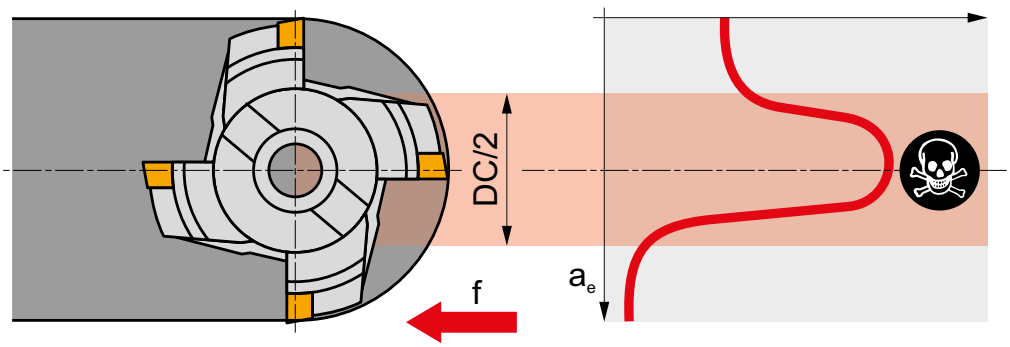

Coolant Benefit	
- - -	Very negative effect on tool life – cooling is not recommended
-	Slightly negative effect on tool life
+ / -	Influence of cooling may be both positive and negative – decisive factor is specific working conditions
+ +	Positive effect on tool life – cooling is recommended

Attribute Strength	
	Level 1 – 5

When performing a milling operation, the edge of the milling cutter almost always makes interrupted (intermittent) cuts. Each edge enters and exits the workpiece at least once within a single revolution of the tool.
In addition, a periodic change in chip thickness takes place during each revolution of the milling cutter. This results in fluctuations in the size and direction of the tangential component of the cutting force. The edge of the milling cutter is thus subjected to cyclic stress which results in specific wear. The durability of the milling cutter edge is therefore dependent on the conditions in which the edge enters and exits the workpiece. Proper choice of these conditions significantly affects the milling process and its results in terms of cutting power and quality of the machined surface. At the moment the edge enters or exits the workpiece, the edge is subjected to more or less intense mechanical shock which causes mechanical stress in the immediate vicinity of the cutting edge. If engagement conditions are chosen incorrectly, this shock can cause brittle damage to the edge, in the form of either fracturing or crumbling of the edge.
Position of the milling cutter relative to the workpiece is thus a very important factor. There are essentially three possible milling cutter positions: side up milling, centre milling and side down milling. For indexable tools, we recommend using co-directional engagement (so that the cutter forms thick chips on entry and thin chips on exit). However, there are notable exceptions (workpieces with surface skin, machines with worn feed screws...).

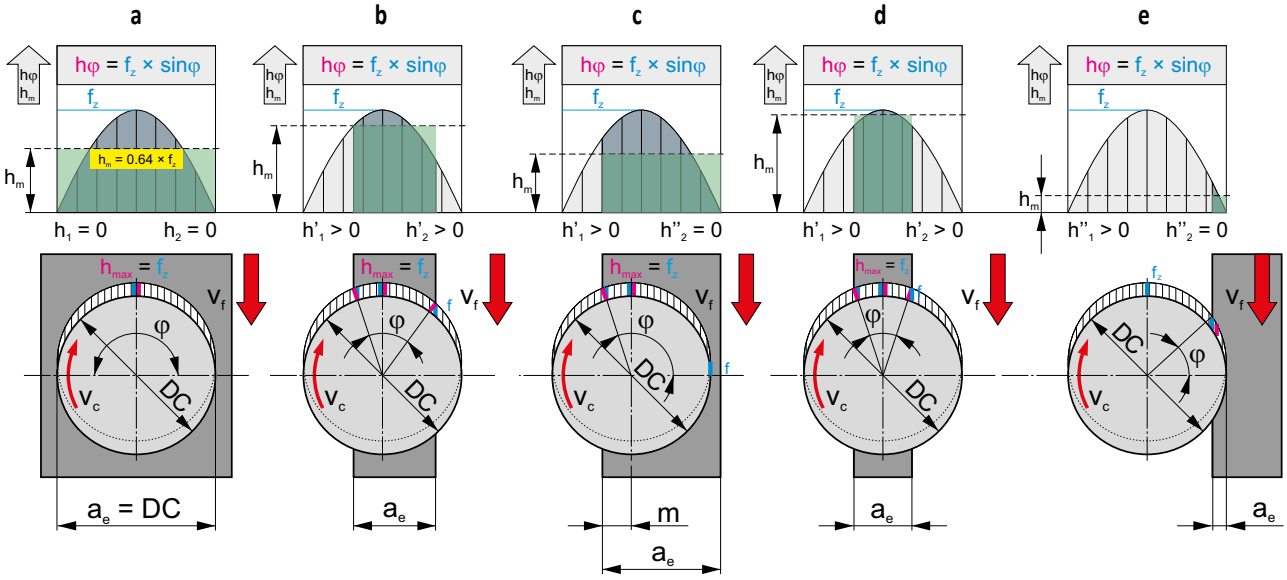

During face milling, where the width of the milled surface a_e is equal to the diameter of the milling cutter, follow the values recommended specifically for the inserts. If the engagement width is less than the diameter of the milling cutter, then the key factor is whether we machine with the centre or the side of the milling cutter, as mentioned above. In both cases, corrections in feed and cutting speed should be made (see correction tables on page 697). Either way, we should try to ensure that the tool does not enter or exit the cut in an area close to the centre of the milling cutter (so-called dead zone).

When the edge exits from the cut, this is accompanied by both stressing of the edge due to rapid cooling of the surface layers of the insert near the cutting edge and by mechanical shock caused by the release of flexible deformations, particularly in the surface layers of the workpiece after a rapid decrease in cutting force.

As stated above, chip thickness *h* changes during a single revolution depending on the angle φ in line with the formula $h\varphi = f_z \times sin\varphi$. Maximum chip thickness with steady f_z is reached within the axis of the milling cutter. The average thickness of a chip h_m removed by one tooth during one revolution is calculated as the height of a rectangle with the same area as the area under a sine curve relative to the radial depth of cut a_e. Average chip thickness h_m is dependent on the type of milling cutter and on engagement conditions, particularly the ratio of a_e / DC, feed per tooth f_z and naturally also on the entering angle *KAPR* – κ_r. The following figure shows illustrative examples.

Average chip thickness h_m for milling (with the centre) in accordance with figure a, b, d is calculated based on the formula:

$$h_m = f_z \times sin\,\kappa_r \times \left(57.3 \frac{a_e}{DC \times arcsin \times \left(\frac{a_e}{DC} \right)} \right)$$

Average chip thickness h_m for machining with the side of the milling cutter (figure c, e) is calculated based on the formula:

$$h_m = f_z \times sin\,\kappa_r \times 114.6 \times \left(\frac{a_e}{DC \times arccos \times \left(1 - \frac{2a_e}{DC} \right)} \right)$$

For milling with the side of the cutter in line with figure e, where the a_e / DC ratio is very low (< 0.2), average chip thickness h_m can be calculated using the simplified formula:

$$h_m = f_z \times sin\,\kappa_r \times \sqrt{\frac{a_e}{DC}}$$

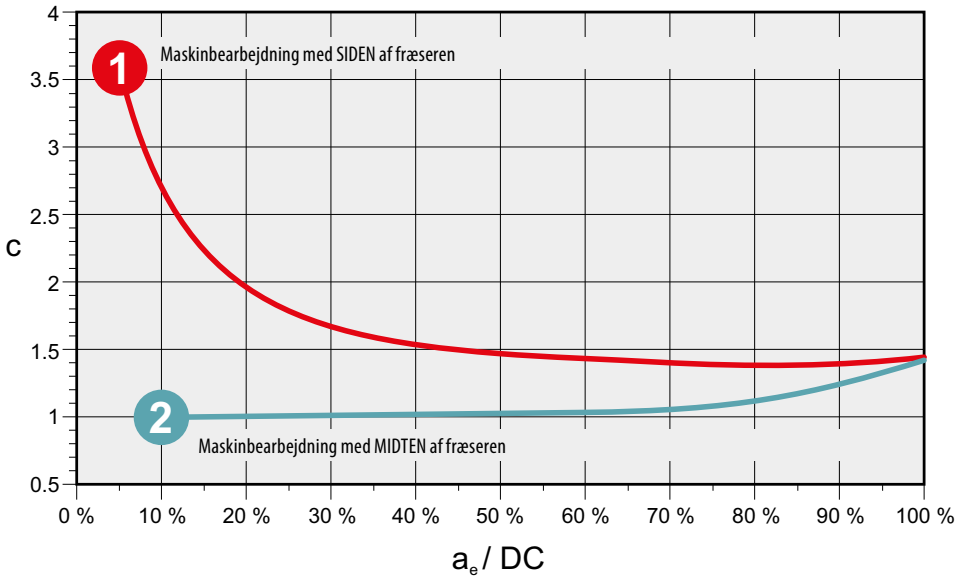

Hvor:

h_m	Gennemsnitlig spåntykkelse (mm)
f_z	Tilspænding pr. tand (mm/tand)
a_e	Radial skæredybde (mm)
DC	Diameter (mm)
κ_r	Indstillingsvinkel for hovedskær *KAPR* (°)

For optimal application of any milling tool, we recommend checking chip thickness, or rather, using the recommended h_m range to choose (calculate) the proper feed rate.

It is, of course, also necessary to take into account the geometry of the indexable insert itself. To calculate f_z, you can use the formulae provided above or use the following formula. The values of coefficient c can be derived from the following chart:

$$f_z = \frac{h_m}{sin \times \kappa_r} \times c$$

Each tool type listed in this catalogue has its own optimum range of average chip thickness. Using values lower than listed in this range may prevent the tool from cutting or, rather, may subject the insert to excessive wear and, in extreme cases, may even destroy it in the process. Similarly, exceeding the recommended values may destroy the insert by overloading the tool. The ranges of recommended average chip thickness are listed directly by each tool family.

The full range of chip thickness can only be used for groups P and K. The lower limit of chip thickness must be adjusted (taken as higher than listed) for groups M and S and for tougher materials from group N. The upper limit must be lowered for groups H, S and slightly also for tougher materials from group M. On the contrary, it is possible to increase the upper limit of recommended average chip thickness by approx. 10 – 15 % when machining soft materials from group N.

PRAMET

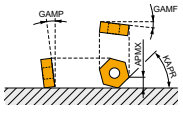

S

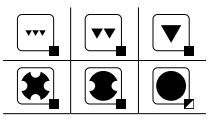

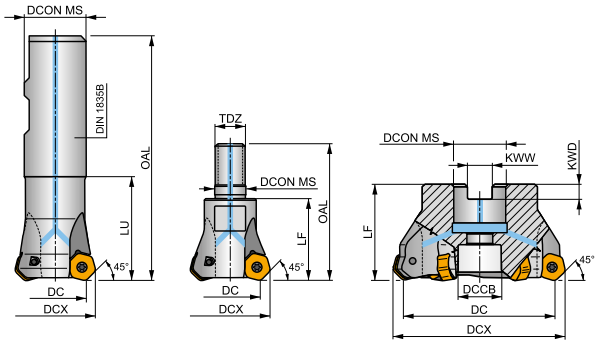

ECON HN06 45° Face Mill with Double Negative Design and Internal Coolant

Highly productive 45° face mill utilising double sided HN.. 06 style inserts with APMX of 3 mm. Roughing, finishing and chamfering. Economical insert with 12 cutting edges. Differential tooth pitch. Weldon, modular and arbor style available in range from Ø25 up to Ø125 mm. Body treated for longer tool life.

KAPR	45°
APMX	3.0 mm

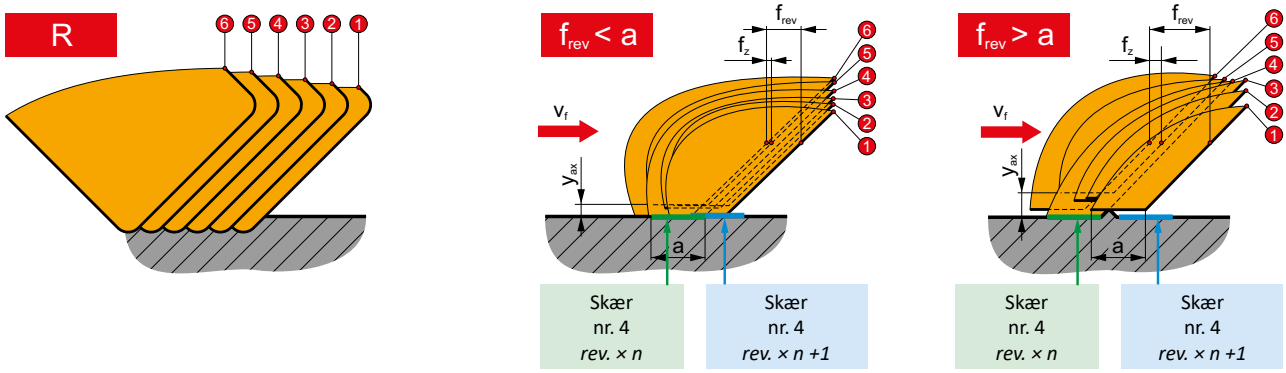

Optimum range of average chip thickness (mm)

| | | |

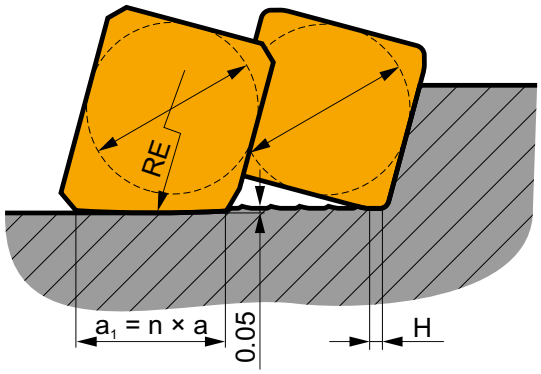

One of the key criteria in finishing operations is the resulting roughness of the machined surface. The following article will therefore provide several tips on how to approach this issue.

Face Milling

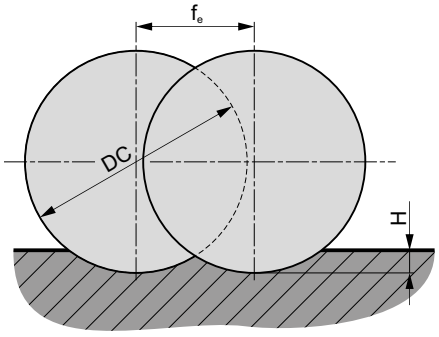

When performing any milling operation, the machined surface is shaped by multiple edges. The microgeometry of the surface is thus dependent on the axial runout of the individual edges of the milling cutter. The most axially protruding edges are the ones that shape the machined surface. The resulting roughness of the milled surface is, to a large extent, influenced by the design of the tip of the indexable insert. If the tip of the indexable insert has a radius, it creates imperfections on the surface. The size of these imperfections is dependent on the corner radius and feed speed. For inserts with smoothing segments, the rule of thumb is that the feed per revolution must be less than 80 % of the size of the smoothing segment. In larger (multi-tooth) cutters, fulfilling this condition can sometimes be problematic, since the maximum feed value $f_z = 0.8 \times a / z$ may approach the lower limit recommended for certain types of insert geometry (the feed speed is lower than the width of the facet in the feed direction). Using lower feed speeds usually results in an increase in cutting resistance, leading to reduced tool life.

In that case, the best solution is to use a milling cutter with fewer teeth or to reduce the number of teeth on the milling cutter (only fitting an insert onto every other tooth of milling cutters with an even number of teeth). There is, however, a risk of reduced productivity. Another alternative is the use of so-called wiper inserts (if such inserts are available for the given type of tool). Even this solution has its drawbacks, however. For milling cutters with a small diameter (approx. 63 mm and less) the speed gradient is too high and there is a risk of tearing or smearing of the surface (edge build-up) towards the centre of the milling cutter when machining tough materials.
Information about the size of smoothing segments can be found at the beginning of technical information in the catalogue section.

As regards the majority of other types of milling operations, the approximate maximum surface roughness can again be calculated. To do so, we can use the following formula, here accompanied by a graphical explanation.

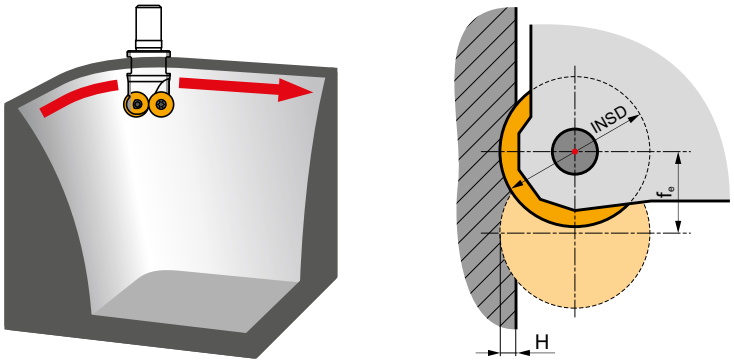

$$H = \frac{f_e^2}{4 \times DC} \rightarrow f_e = \sqrt{4 \times DC \times H}$$

Where and when to apply this formula:

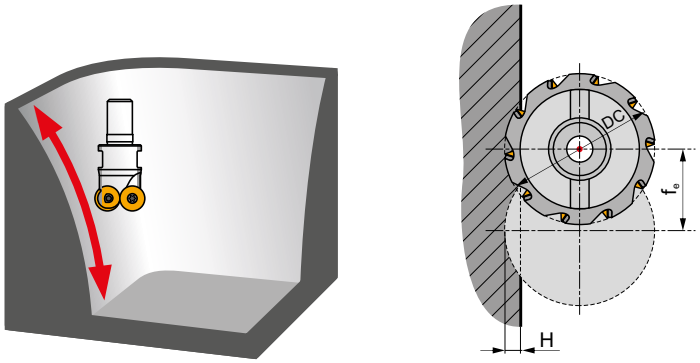

1) When determining line spacing during peripheral linear machining with toric* or ball-nose milling cutters.

* Substitute insert diameter for *INSD.*

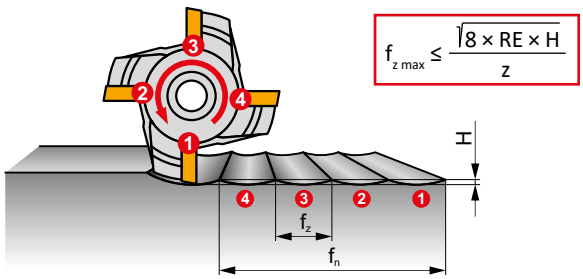

2) When determining line spacing during transverse linear machining with (not only) toric milling cutters and during plunge milling **.

** Substitute milling cutter diameter for *DC.*

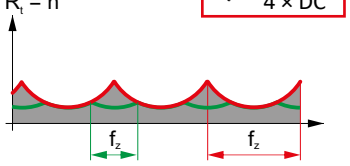

3) When determining feed per tooth during contour milling (side milling).***

*** Substitute milling cutter diameter for *DC* and divide by the number of teeth.

$$f_{z\,max} \leq \frac{\sqrt{8 \times RE \times H}}{z}$$

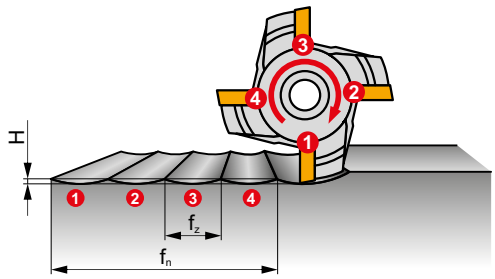

$$R_t = \frac{f_z^2}{4 \times DC}$$

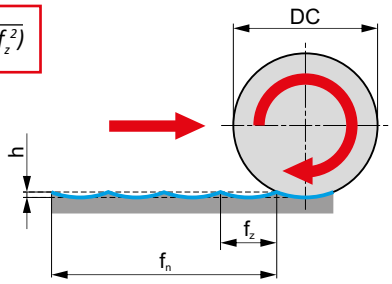

MACHINED SURFACE ROUGHNESS

Surface roughness in the radial direction, i.e. during side milling (contour or bottom of a slot milled with a disc milling cutter) is calculated using the following formula:

Substitute milling cutter diameter for *DC*.

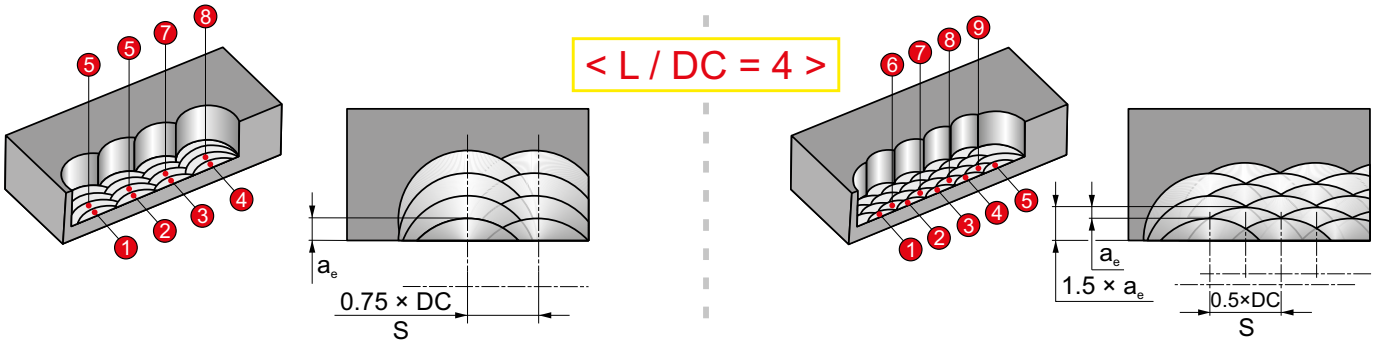

$$h = \frac{1}{2}\left(DC - \sqrt{DC^2 - f_z^2}\right)$$

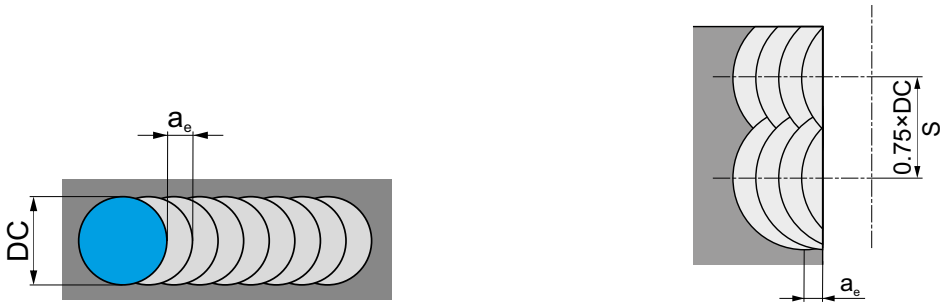

Plunge Milling (Slotting)

For this technology, you will find recommendations for the maximum permitted radial depth of cut for a given tool group. In this case, tool overhang *L* plays a vital role. It is therefore recommended to use a higher overhang (*L / DC > 4*) when creating wider recesses and to adjust engagement conditions in line with the following figures:

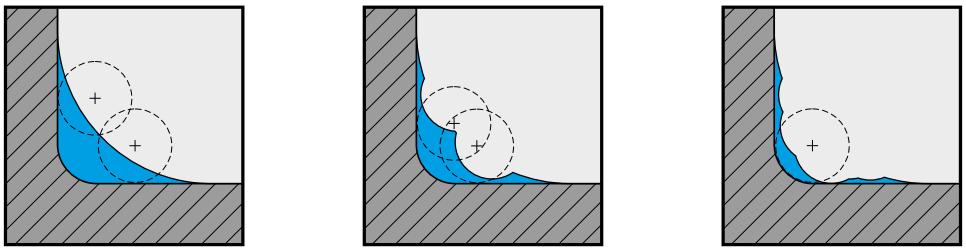

Contour milling

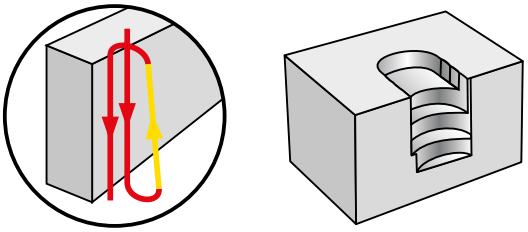

Slot milling

Shoulder milling

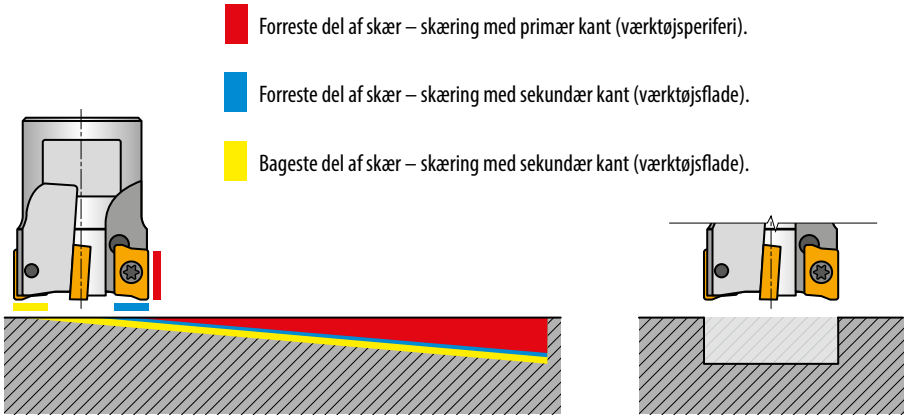

In shoulder milling, the mutual offset of paths should also not exceed ¾ of the milling cutter diameter (and should be gradually decreased towards the corner).

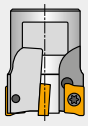

When creating programmes for this technology, you should avoid passes over already machined surfaces (bottom). In other words, we do not recommend using a so-called drilling cycle. When selecting engagement conditions, make sure that more than one tooth is engaged at all times. We also recommend gradually reducing the axial depth of cut (plunge depth), i.e. creating a "staircase" structure. Also keep in mind that plunge milling requires the use of lower speeds and feeds per tooth compared to traditional methods.

Ramping

Ramping, dvs. toakset progressiv sænkning, er en teknologi, der anvender tre forskellige skæremetoder samtidig:

An important parameter here is the ramp angle, i.e. the descent in the Z axis across the given stretch. Some tools (HFC) allow descending at a lower angle but with a higher feed, or allow a higher ramp angle with lower feed to be used. These angles or descents across the given section are listed in technical recommendations.

	
	Ned i maks. vinkel og lige tilbage og igen ned i maks. vinkel og lige tilbage...
	Der og tilbage i en mindre (halv) vinkel og til sidst lige udgang.
	Ned i maks. vinkel, lige tilbage med længde *DC* og derefter ned i maks. vinkel, gentag lige ...
	Ned i maks. vinkel og derefter op med længde *X* og tilbage ned i maks. vinkel $X = tg \alpha (DC - W1)$

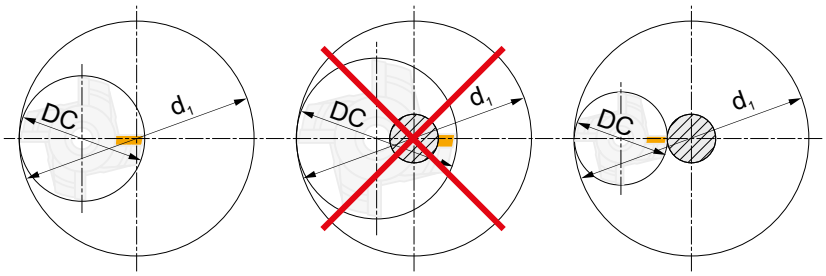

When choosing the feed speed, we advise following the recommendation given for slot milling. If the slot is deeper (i.e. first pass at an angle, second to level off), you must select one of four basic programme variants for the consecutive steps.

Hvor:

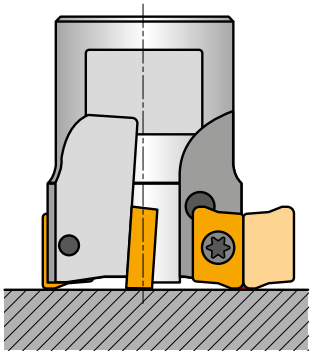

X	Tilbagespring (trin) (mm)
α	Nedstigningsvinkel (°)
DC	Fræserdiameter (mm)
W1	Skærbredde (mm)

Milling using Circular or Helical Interpolation

This method is analogous to ramping, except it is performed along a circular path. In this case, one of the most important factors is the milling cutter diameter or minimum and maximum diameter of the hole we are able to machine with the given milling cutter type (this information is vital only when using milling cutters without central cutting edges). If the milling cutter diameter is too large, the path of the insert will not pass through the axis of the hole, resulting in a protrusion which will collide with the face of the tool and may potentially destroy the tool completely. On the other hand, if the diameter of the milling cutter is too small, the core will remain inside the hole axis and must then be milled off separately.

DC = cca 0.5 × d_1 | DC > 0.5 × d_1 | DC < 0.5 × d_1

D_{max} – Huldiameter

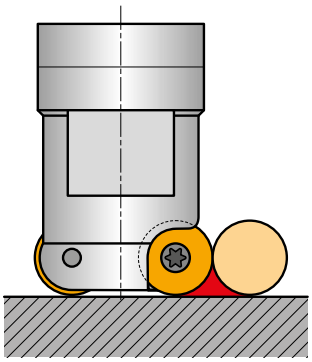

DC – Fræserdiameter

INSD – Skærdiameter

RE – Hjørneradius

BS – Wipersegments bredde

b – Maks. a_e for sporfræsning

Maks. huldiameter

For blind holes, you can achieve a flat bottom by having the tool pass over the bottom's centre.

For through hole: $D_{max} = 2 \times DC$		For through hole: $D_{max} = 2 \times DC$

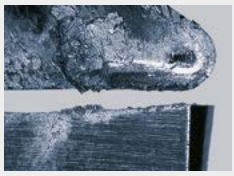

Min. huldiameter

For through hole: $D_{min} = (DC - b) \times 2$		For through hole: $D_{min} = (DC - 0.8\ INSD) \times 2$
For flat bottom: $D_{min} = (DC - (RE + BS)) \times 2$		For flat bottom: $D_{min} = (DC - 0.5\ INSD) \times 2$

Recommendations include tables listing the minimum hole diameter, maximum hole diameter and in-axis descent angle values for these diameters (in some cases there will be two tables: one for standard insert geometry and another for HFC).

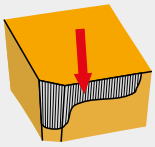

AKKUMULERET KANT

		Dette har ingen betydning.
(MT)CVD / PVD	++	Enhver belægning (den afgørende faktor er anti-adhæsionseffekt).
f	↑	Jo højere tilspændingshastighed, jo mindre sandsynlighed for dannelse af løsæg.
v	↓↑	Ændr (normalt = øg) skærehastigheden.
a_p		Dette har ingen betydning.
	↓↑	Brug en mere positiv geometri (der opstår ikke løsæg, hvis hældningsvinklen er større end 40°).
	-	Brug et kølemiddel med more effektive egenskaber til modvirkning af sammenklæbning (vi anbefaler ikke at bruge kølemiddel til fræsning).

FASSLID

	↑	Brug et mere slidbestandigt substrat (H).
(MT)CVD / PVD	++	Enhver belægning (den afgørende faktor er hårdheden – TiC, TiCN).
f	↑	Øg tilspændingen (især hvis den er under 0.1 mm).
v	↓	Reducer skærehastigheden.
a_p		Dette har ingen betydning.
	↑	Det vigtigste er at øge frivinklen.
	+	Det kan hjælpe, men kun ved ideelle arbejdsforhold.

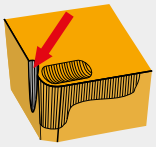

KRATERDANNELSE

	↑	Brug et mere slidbestandigt substrat (S).
(MT)CVD / PVD	++	CVD-belægning (den afgørende faktor er bestandighed mod oxidation – α Al_2O_3).
f	↑	Tilspændingen påvirker kraterets form og position.
v	↓	Reducer skærehastigheden.
a_p	↓	Minimal effekt.
	↑	Brug en mere positiv skæregeometri.
	++	Det kan hjælpe, men kun ved ideelle arbejdsforhold.

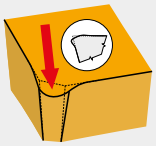

OXIDATIONSRILLE PÅ MINDRE SKÆR

	↑	Brug et mere slidbestandigt substrat (S).
(MT)CVD PVD	+ +	CVD-belægning (den afgørende faktor er bestandighed mod oxidation – α Al_2O_3).
f	↓	Tilspændingen påvirker rillens form og position.
v	↓	Reducer skærehastigheden.
a_p	↓	Minimal effekt.
	↑	Brug en anden (mere positiv) skæregeometri.
	+ +	Det kan hjælpe, men kun ved ideelle arbejdsforhold.

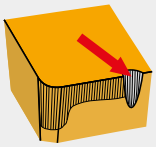

PLASTDEFORMERING

	↑	Brug af et mere slidbestandigt substrat (Co-indholdet er afgørende).
(MT)CVD PVD	+	Enhver belægning (den afgørende faktor er friktion).
f	↓	Reducer tilspændingshastigheden.
v	↓	Reducer skærehastigheden.
a_p	↓	Minimal effekt.
	↑	Brug en anden (mere positiv) skæregeometri.
	+ +	Det kan hjælpe, men kun ved ideelle arbejdsforhold.

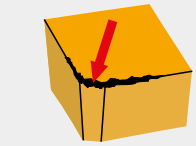

KÆRVSLID

	↑↓	Det afhænger af skadens karakter (slibende – brug et mere slidbestandigt substrat; brud – brug et sejere substrat).
(MT)CVD PVD	+ +	CVD-belægning (den afgørende faktor er bestandighed mod oxidation – α Al_2O_3).
f	↓	Tilspændingen påvirker intensiteten, men mindre end skærehastigheden.
v	↓	Reducer skærehastigheden.
a_p	↑↓	Brug en anden skæredybde.
	↓	Brug en mindre positiv skæregeometri.
	+	Det kan hjælpe, men kun ved ideelle arbejdsforhold.
		Brug værktøj med mindre indstillingsvinkel.

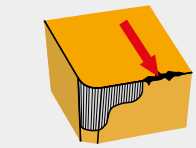

UDFLISNING VED SKÆREÆG

	↓	(H) partikel har stor betydning.
(MT)CVD / PVD	+	PVD-belægning anbefales.
f	↓	Tilspændingen påvirker intensiteten, men mindre end skærehastigheden.
v	↑↓	Det handler om vibrationer.
a_p	↓	Dette har ingen betydning.
	↑	Øgning af hældningsvinklen for at reducere skærekraften
	-	Intet kølemiddel (det er dog muligt at bruge luft til at fjerne spåner fra skæreområdet).
		Brug bedre arbejdsforhold (a_e / DC).

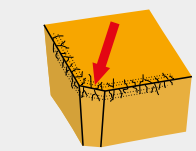

FEJL FOR SKÆR

	↓	(H) partikel har stor betydning.
(MT)CVD / PVD	+	PVD-belægning anbefales.
f	↑↓	God spånbrydning er meget vigtigt.
v	↑↓	Det handler om spånbrydning og vibrationer.
a_p	↑↓	Reducerer belastningen (vigtigt for maskinbearbejdning med lang overlapning).
	↓	Brug en mindre positiv skæregeometri
		Dette har ingen betydning.
		Brug bedre arbejdsforhold, reducer skærefrigangstilspændingen (skæring).

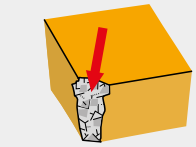

DANNELSE AF REVNER

	↓	(H) partikel har stor betydning.
(MT)CVD / PVD	+ +	PVD-belægning anbefales.
f	↓	Tilspændingen påvirker intensiteten, men mindre end skærehastigheden.
v	↓	Lavere hastighed betyder lavere temperatur.
a_p		Dette har ingen betydning.
	↑	Brug en anden (mere positiv) skæregeometri.
	- - -	Intet kølemiddel (det er dog muligt at bruge luft til at fjerne spåner fra skæreområdet).
		Brug bedre arbejdsforhold (a_e / DC).

SKÆREÆG BRUD

	↓	(H) partikel har stor betydning.
(MT)CVD / PVD	+	PVD-belægning anbefales.
	↓	Skærekraften er meget vigtig.
	↑↓	Det handler om spånudtømning og vibrationer.
	↓	Reducerer belastningen.
	↓	Brug en mindre positiv skæregeometri.
		Dette har ingen betydning.
		Brug bedre arbejdsforhold (a_e / DC).

DÅRLIG OVERFLADEKVALITET

Beskrivelse og årsag:

Utallige årsager afhængigt af arbejdsemnets materiale, skæreforholdene (tilspændingshastighed og skæreforhold), skærets tilstand, omfanget og typen af slid samt tilstanden og stivheden for maskine-værktøj-arbejdsemne-opsætningen.

- Forkert værktøj valgt
- Forkert spåntykkelse
- Forkert skærehastighed
- Der skal bruges kølemiddel
- Høj tilspændingshastighed

Afhjælpning:

- Brug en indsats til finishbehandling eller en indsats med et finishbehandlingssegment
- Brug et skær med egnet skæregeometri
- Reducer tilspændingshastigheden
- Juster (normalt = øg) skærehastigheden
- Brug kølemiddel eller smøremiddel (MQL)
- Eliminer vibrationer
- Brug et værktøj, hvormed positionen for den enkelte skær kan justeres mere nøjagtigt
- Ændr spåntykkelsen (ændr maskinbearbejdningsforholdene)

VIBRATIONER

Beskrivelse og årsag:

Dette er et meget almindeligt problem, som primært skyldes et uafbalanceret arbejdsemne eller værktøj, ustabil fastgørelse af den maskinbearbejdede del og høj skærekraft..

- Lille stivhed for opsætning med maskine-værktøj-arbejdsemne
- For stor skæredybde (både aksial og radial)
- Udløb – dårligt arbejdsemne eller dårlig værktøjsbalance
- Stor værktøjsoverlapning

Afhjælpning:

- Kontrollér stabiliteten af arbejdsemnets fastgørelse
- Kontrollér stabiliteten af værktøjets fastgørelse
- Reducer skæredybden
- Brug et kortere værktøj
- Ændr skærehastigheden
- Reducer spåntykkelsen (ændr skære- eller maskinbearbejdningsforholdene)
- Velg et mer lettskjærende vendeskjær for å minske skjærekreftene
- Velg verktøy med mindre ingrepsvinkel

GRATER

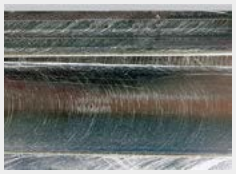

Beskrivelse og årsag:

Förekommer oftast i mjuka stål och plastiska material.

Afhjælpning:

- Använd skär med vassa eggar
- Använd skär med positiv geometri
- Använd skär med mindre ingreppsvinkel

FEJL I ARBEJDSEMNETS MÅL OG FORM

Beskrivelse og årsag:

Afhænger af en række faktorer.

Afhjælpning:

- Brug en slidbestandig vendeskær
- Øg stabiliteten for fræseren og arbejdsemnet
- Minimer værktøjslængde
- Brug et arbejdsemne med en passende askinbearbejdningstolerance

UTILSTRÆKKELIG SPÅNDANNELSE

Beskrivelse og årsag:

Brug af en spån med en egnet form er lige så vigtigt som holdbarheden (værktøjets servicelevetid). Arbejdsemnets materiale, tilspændingshastigheden, skæredybden og skæregeometrien er alt sammen med til at påvirke spåndannelsen. En spån, der er for lang, er uacceptabel af forskellige årsager, mens en spån, der er for kort, er uønsket, da den hænger ud over skæret og forårsager vibrationer.

Afhjælpning:

- Ændre tilspændingshastigheden og skæredybden
- Brug en mere velegnet skæregeometri
- Ændr skæreforholdene

KONTROLLER VENDESKÆRET LEJETILSTAND

Før fastspænding af et nyt vendeskær eller ændring af skæret skal lejet rengøres, og dets tilstand eller tilstanden for ambolten og kilen skal kontrolleres (der skal især kontrolleres for skader under vendeskæret hjørne).

KONTROL OG SERVICE FOR FASTSPÆNDINGSDELENE

Det er også vigtigt at kontrollere fastspændingsdelene, herunder spændegreb, skruer, kiler og klemmer. Brug kun originale, ubeskadigede dele (kan findes i kataloget). Smør regelmæssigt gevindene og skruernes kontaktflade, f.eks. ved hjælp af varmeresistent smøremiddel (MOLYCOTE). Ved montering og demontering må der kun bruges de skruetrækkere og nøgler, der er anført i vores katalog, eller som anbefales af værktøjsproducenten. Sørg for at bruge den korrekte tilspænding (proportionelt) – det anbefales at bruge en momentnøgle.

KONTROLLER TILSPÆNDINGEN

Kontrollér før tilspænding, at vendeskæret sidder korrekt på hele bindefladen og i den radiale og aksiale retning. Vendeskæret og værktøjer skal altid være rene og ubeskadigede.

FORMLER

Værdi	Enhed	Formel
Antal omdrejninger	(omdr/min)	$n = \frac{v_c \times 1000}{DC \times \pi}$
Skærehastighed	(m/min)	$v_c = \frac{\pi \times DC \times n}{1000}$

SIMPLY RELIABLE

Som en professionel kan du vurdere kvaliteten af dit arbejdet kun ved at studere metalspånen. Metalspånen har en ren og ukompliceret form, der fortæller en historie. Det er derfor, vi bruger dette symbol til at illustrere vores pålidelighed, «**Simply Reliable**».
